APPENDIX 1: SDG EVIDENCES 21

1 PROJECT DETAILS

1.1 Summary Description of the Implementation Status of the Project

Winsome Textile Industries Ltd. (hereinafter also called as WTIL), a leading manufacturer of textile product, having its operations in Baddi, Himanchal Pradesh, India. The project aims to generate renewable electricity for captive consumption and minimize carbon foot print in long term.

The project activity is power generation from a 3.5 MW hydroelectric project based on Manuni Khad stream, a tributary of river Beas at village Khaniara, Dharamshala, District Kangra, Himachal Pradesh. The project activity is a run-of-river project being developed by M/s Winsome Textile Industries Ltd. The project activity comprises 2 Numbers of Pelton Turbines each with a generator output capacity of 1750 kW for generation of electricity.

The project was allotted to the M/s Winsome Textile Industries Ltd. on a Build, Own, Operate and Maintain (BOOM) basis for a period of 40 years. Wheeling and Banking Agreement (PPA) has been signed with the Himachal Pradesh State Electricity Board (HPSEB), the generated electricity is being used for captive consumption at its manufacturing unit Baddi.

The purpose of the project activity is to produce renewable energy using hydro power for captive consumption. In the absence of the project activity equivalent amount of electricity would have been generated by the operation of grid connected fossil fuel based power plants. The Project activity thus reduces the anthropogenic emissions of greenhouse gases (GHGs) in to the atmosphere associated with the equivalent amount of electricity generation from the fossil fuel based grid connected power plant.

The project activity has started construction in 2011 and commissioned both the turbine on 31/03/2017. The project activity is operational since commissioning with planned outage and maintenance. The project activity has injected 24,045 MWh electricity to grid during current monitoring period i.e. from 1/1/2020 to 31/12/2021 which has resulted 22,246 tCO_2e GHG emission reduction.

1.2 Sectoral Scope and Project Type

Type : I - Renewable Energy Industries

Category : AMS-I.D. Grid Connected Renewable Electricity Generation[1]

Version : 18 EB 61

Date : 03/06/2011

Tools Used : Tool to calculate the emission factor for an electricity system[2] Version 02.2.1 / EB – 63 Annex 19

: Tool to calculate baseline, project and/or leakage emissions from electricity consumption[3] Version 1/ EB – 39 Annex 7

1.3 Project Proponent

Organization name	Winsome Textile Industries Ltd.
Contact person	Mr Sanjeev Mittal
Title	General Manager-Electrical & Electronics
Address	1, Industrial Area, Baddi, Himanchal Pradesh, India
Telephone	+91 78077 09812
Email	smittal@winsometextile.com

1.4 Other Entities Involved in the Project

Organization name	EcoCapita Consulting Private Limited
Role in the Project	Consultant
Contact person	Sahil Wali
Title	VP
Address	Ultimate Plaza 2, First floor, 24, Mandakini Colony, Kolar main road, Bhopal – 452042, M.P
Telephone	+91 62649 02261
Email	projects@ecocapita.in

[2] http://cdm.unfccc.int/methodologies/PAmethodologies/tools/am-tool-07-v2.2.1.pdf/history_view

[3] http://cdm.unfccc.int/methodologies/PAmethodologies/tools/am-tool-05-v1.pdf/history_view

1.5 Project Start Date

The start date of the project activity is 31 March 2017, which is date of commissioning of the turbines.

1.6 Project Crediting Period

Crediting period start date: 31/03/2017

VCS Project crediting period: 10 years, this may be renewed at most twice.

First Crediting period: 31/03/2017 - 30/03/2027

1.7 Project Location

The proposed project activity is located at Village Khaniyara, Dharmashala in Kangra District, Himanchal Pradesh, India . The Project site is connected by roads to the nearest town. The nearest airport is Dharamshala around 40 Km.

The physical address and geographic co-ordinate of project site is provided above.

Geo-coordinates are 320 11' 30" N 760 11' 30" E.

1.8 Title and Reference of Methodology

Type : I - Renewable Energy Industries

Category : AMS-I.D. Grid Connected Renewable Electricity Generation[4]

Version : 18, EB 81, Annex 14

Date : 28/11/2014

Tools Used : Tool to calculate the emission factor for an electricity system[5] Version 07.0.0 / EB – 100 Annex 4

: "Tool to calculate project or leakage CO2 emissions from fossil fuel combustion"[6] Version 03, Annex 3, EB93.

1.9 Participation under other GHG Programs

The project activity has not been registered or seeking registration under any other GHG programs. The project has not participated under any other GHG program.

1.10 Other Forms of Credit

The project activity is solely registered with VERRA standard and thereby doesn't availing credits from any other program.

1.11 Sustainable Development Contributions

Contribution to sustainable development:

Ministry of Environment and Forests, has stipulated economic, social, environment and technological well-being as the four indicators of sustainable development. The project contributes to sustainable development using the following ways.

1. Social well-being:

The proposed project activity leads to alleviation of poverty by establishing direct and indirect employment opportunities by contributing local economic activity. It also strengthens the provision of electricity to local grid of the state electricity utility. The project improves the quality, frequency and availability of electricity which is being fed into a power-deficit grid. Thus, the provision of electricity through the project activity has a direct and positive impact on the local residents of the area.

2. Economic well-being:

With the proposed project activity, employment opportunities has increased in the local area, thereby improving economic conditions of the local population. The project has created indirect employment opportunities for skilled and unskilled workers during construction, which otherwise would not happen in the absence of the project. In addition, the project also creates direct permanent employment for operation of the project. By promoting the decentralization of economic power, the project contributes in bringing economic sustainability around the plant site.**3. Environmental well-being:**

The project utilizes hydro energy for generating electricity which otherwise would have been generated through conventional fuel based power plants, thereby

contributing to the reduction of associated GHG emissions (emissions of pollutants per unit of energy generated). The hydro power projects do not have end products in the form of solid waste (ash etc.) thereby, further contributing to the environmental sustainability.

4. Technological well-being:

The project has helped achieving economies of scale for small hydro projects and will contribute to the development of an infrastructure that can support such technologies. The project activity does not involve the technology transfer from any country.

In view of the above, the PP has considered that the project activity profoundly contributes to the sustainable development.

Table 1: Sustainable Development Contributions

Row number	SDG Target	SDG Indicator	Net Impact on SDG Indicator	Current Project Contributions	Contributions Over Project Lifetime
1)	7.2	7.2.1 Renewable energy share in the total final energy consumption	Implemented activities to increase	The project yielded a total net power generation of 49447.7 MWh during the reporting period. The entirety of the production was consumed by grid users, therefore increasing renewable energy share in the total final energy consumption.	The project has yielded a total net power generation of 53,322.7 MWh over its monitored lifetime. The entirety of the production was consumed by grid users, therefore increasing renewable energy share in the total final energy consumption.
2)	13.0	Tons of greenhouse gas emissions avoided or removed	Implemented activities to increase	The project replaced anthropogenic emissions of greenhouse gases (GHG) of 45,291 tCO_2e during the reporting period.	The project has replaced anthropogenic emissions of greenhouse gases (GHG) of 49,141 tCO_2e over its lifetime.

3	3.8	3.8.1 Coverage of essential health services (defined as the average coverage of essential services based on tracer interventions that include reproductive, maternal, new -born and child health, infectious diseases, non -communicable diseases and service capacity and access, among the general and the most disadvantaged population)	Implemented activities to decrease	Owing to the COVID-19 pandemic being an infectious disease, the project proponent has made significant contributions of voluntary distribution of COVID relief items like masks, sanitizers, medicines as well as essential food supplies through Panchayat Pradhan, Sub-district Magistrate (SDM), local NGOs, etc in the nearby areas to the project activity which lacked access to such basic services. Project Proponent has incurred expenditure cumulatively amounted to INR 74,781[7] and this intervention helped in preventing the spread of an infectious virus disease.	Owing to the COVID-19 pandemic being an infectious disease, the project proponent has made significant contributions of voluntary distribution of COVID relief items like masks, sanitizers, medicines as well as essential food supplies through Panchayat pradhan, Sub-district Magistrate (SDM) in the nearby areas to the project activity which lacked access to such basic services. Project Proponent haas incurred expenditure cumulatively amounted to INR 74,781 and this intervention helped in preventing the spread of an infectious virus disease.

[7] Please refer Appendix 1 for supporting bills as SDG evidence.

2 SAFEGUARDS

2.1 No Net Harm

The facility does not produce any pollution in process of power generation as it utilizes renewable energy source that is hydro energy to generate electricity for captive consumption. Hence there is positive impact on the environment due to this small-scale project activity of reducing the pollution caused by fossil fuels would have been used in baseline scenario. Further this project will have no air pollution, no water pollution and no noise pollution.

The project activity has obtained the No Objection Certificate for Consent to Establish from the concern agencies.

2.2 Local Stakeholder Consultation

The local stakeholder consultation meeting for the proposed project activity has been conducted at project site on 22nd September 2018. The project is a run of the river project and does not change have any dam. It has no associated emissions or other impact on nearby villages. There were no negative comments raised by stakeholders in the local stakeholder consultation meetings and due to the associated benefits stakeholders have appreciated the proposed project activity.

During current monitoring period no complains raised by stakeholders, also no issues were identified in previous stakeholder meeting, which requires change in process or mitigation measures. The project participant has shared the contact details of site in-charge and as per procedure any stakeholder can interact or drop complaint related to project activity if any, which will be analyzed by EcoCapita for if any action required. No negative comments/complaint raised during current and previous monitoring period.

Post consultations the project proponent has also devised a Grievance mechanism to address any concerns of the villagers. A grievance Register with the details of site contact person of Site engineer are available at all the panchayat offices in the project location.

No grievances received during the current and previous monitoring period.

2.3 AFOLU-Specific Safeguards

Not applicable as its renewable energy project.

3 IMPLEMENTATION STATUS

3.1 Implementation Status of the Project Activity

The project activity was commissioned on 31/03/2017 and operational since then. The project activity was operational with planned operation and maintenance during current monitoring period i.e. from 01/01/2020 to 31/12/2021. There were no incidents occurred during current monitoring period, which may impact applicability of monitoring methodology and GHG emission reduction calculation. The project activity is operated as per detailed provided in registered VCS PD.

There were no major shutdowns during current monitoring period.

3.2 Deviations

3.2.1 Methodology Deviations

No deviation in the methodology has been applied to the project activity during the current & previous monitoring period.

3.2.2 Project Description Deviations

The project activity is implemented and operated as per registered VCS PD and no deviation taken during current & previous monitoring period.

3.3 Grouped Projects

The project is not a grouped project activity.

4 DATA AND PARAMETERS

4.1 Data and Parameters Available at Validation

Data / Parameter	$EF_{grid,OM,y}$

Data unit	tCO_2/MWh
Description	Operating Margin CO2 emission factor for the Indian Grid in year y
Source of data	CEA's "Baseline Carbon Dioxide Emission Database Version 13.0"
Value applied	0.97839
Justification of choice of data or description of measurement methods and procedures applied	Calculated in line with "Tool to calculate the emission factor for an electricity system (Version 07.0.0)" using data from Central Electricity Authority of India's (CEA) "Baseline Carbon Dioxide Emission Database Version 13.0". The value used is calculated ex-ante as generation based weighted average of last three years of the operating margin provided in the CEA database. Weighted average = Σi=1 to n (Net generation in operating margin in year i * Simple operating margin in year i)/Σi= 1 to n (Net generation in operating margin of year i).
Purpose of Data	*Calculation of baseline emissions*
Comments	The value is fixed ex-ante.

Data / Parameter	$EF_{grid,BM,y}$
Data unit	tCO_2/MWh
Description	Build Margin CO2 emission factor for the India Grid in year y
Source of data	CEA's "Baseline Carbon Dioxide Emission Database Version 13.0"
Value applied	0.870
Justification of choice of data or description of measurement methods and procedures applied	Calculated in line with "Tool to calculate the emission factor for an electricity system (Version 07.0.0)" using data from Central Electricity Authority of India's (CEA) "Baseline Carbon Dioxide Emission Database Version 13.0". The value is calculated ex-ante as most recent build margin provided by the CEA.
Purpose of Data	Calculation of baseline emissions
Comments	The value is fixed ex-ante.

Data / Parameter	$EF_{grid,CM,y}$
Data unit	tCO2/MWh
Description	Combined Margin CO2 emission factor for the India Grid in year y
Source of data	Central Electricity Authority(CEA) of India Database Version 13.0
Value applied	0.9254
Justification of choice of data or description of measurement methods and procedures applied	This has been calculated based on Operating Margin (OM) and Build Margin (BM) published by Central Electricity Authority (CEA) of India.
Purpose of Data	Calculation of baseline emissions
Comments	The value is fixed ex-ante.

Data / Parameter	$NCV_{diesel,y}$
Data unit	GJ per mass or volume unit.
Description	Net calorific value of diesel.
Source of data	IPCC default values at the upper limit of the uncertainty at a 95% confidence interval as provided in table 1.2 of Chapter1 of Vol. 2 (Energy) of the 2006 IPCC Guidelines on National GHG Inventories
Value applied	43.3 GJ/Ton
Justification of choice of data or description of measurement methods and procedures applied	Fuel supplier does not provide emission factor in their invoices and also this parameter value is not available top through measurement. Also Regional or national default values are not available. Hence IPCC default values at the upper limit of the uncertainty at a 95% confidence interval as provided in table 1.4 of Chapter1 of Vol. 2 (Energy) of the 2006 IPCC Guidelines on National GHG Inventories. This is in line with Methodological tool "Tool to calculate project or leakage CO_2 emissions from fossil fuel combustion" (Version 3.0). In case of density is required, the same is considered as 0.83 Kg/Lit as per CEA database version 12.

Purpose of Data	Calculation of project emissions
Comments	The value is fixed ex-ante.

Data / Parameter	$EF_{CO2,diesel,\ y}$
Data unit	tCO_2/TJ
Description	CO_2 Emission Factor of Diesel
Source of data	IPCC default values at the upper limit of the uncertainty at a 95% confidence interval as provided in table 1.4 of Chapter1 of Vol. 2 (Energy) of the 2006 IPCC Guidelines on National GHG Inventories
Value applied	74.8
Justification of choice of data or description of measurement methods and procedures applied	Fuel supplier does not provide emission factor in their invoices and also this parameter value is not available top through measurement. Also Regional or national default values are not available. Hence IPCC default values at the upper limit of the uncertainty at a 95% confidence interval as provided in table 1.4 of Chapter1 of Vol. 2 (Energy) of the 2006 IPCC Guidelines on National GHG Inventories. This is in line with Methodological tool "Tool to calculate project or leakage CO_2 emissions from fossil fuel combustion" (Version3.0).
Purpose of Data	Calculation of project emissions
Comments	The value is fixed ex-ante.

4.2 Data and Parameters Monitored

Data / Parameter	$EG_{PJ,Y}$
Data unit	MWh
Description	Quantity of net electricity generation supplied by the project plant to the grid in year y
Source of data	ABT Meter Report by MRI
Description of measurement methods and procedures to be applied	*The value of net electricity generation supplied to the grid as per ABT Meter Report by MRI forms the basis for calculation of the emission reductions.* *Monthly meter readings are taken from the main and check meter installed at metering point and certified by*

<table>
<tr><td></td><td>the representatives of SEB Officials and the representatives of the project proponent.</td></tr>

Purpose of the data	Calculation of project emissions
Calculation method	Monitored
Comments	Data will be archived for crediting period +2 years.

4.3 Monitoring Plan

This monitoring plan is developed in accordance with the modalities and procedures for small scale VCS project activities and in line with the guidance provided in the applied methodology.

The monitoring plan, which will be implemented by the project proponents, describes about overall monitoring organization, Internal reporting procedure for data collection and archiving, Calibration of measurement equipment's, Training procedures and internal audit procedures.

Data and parameters, which will be monitored under this monitoring plan as sited in 4.2 will be measured and strictly monitored at the project site by means of calibrated instruments.

The monitoring plan structure and the roles of the different member in the monitoring plan are explained below.

Internal reporting procedure: Technicians and operators are responsible for the recording of the relevant data in plant log books. Shift in-charges are also responsible of QA/QC of data recorded and maintenance of log-books and other records.

These records in plant log books will consolidate in the form of monthly Generation report by plant supervisor and will be submitted to plant manager for review. The

Management, who represents the overall responsibility on the project activity, will be able, with this operational structure, to monitor the development of the project activity and make the relevant amendments to the process.

The VCS monitoring team will compose the following staff:

Position Report to:	Position Report to:
Operators Site Engineer	Site Engineer Site In-charge
Site Engineer Site In-charge	Site In-charge General Manager
Site In-charge General Manager	Plant head Director
Plant head Director	

Monitoring provisions

Training and maintenance:

All persons that form the part of the VCS Project Management Team shall receive appropriate training which shall provide an overview of the VCS and cover all elements of monitoring plan in detail. Training for operating and maintaining the plant shall also be provided.

Emergency Preparedness:

Being a small hydro plant intensive emergency preparation is not needed, however, the following may be highlighted:

- There are no critical loads that may require emergency power supply in case of total outage.
- A fire extinguisher has been installed in case of small fires
- Information regarding any safety earthing systems in place.

5 QUANTIFICATION OF GHG EMISSION REDUCTIONS AND REMOVALS

5.1 Baseline Emissions

The baseline emissions are calculated as follows:

$BE_y = EG_{PJ,y} \times EF_{CO2,grid,y}$

Where,

$EG_{PJ,y} = EG_{PJ,facility,y}$

$EG_{PJ,y}$ =31857.22 MWh/year

$EF_{CO2,grid,y}$=$EF_{CM,y}$ =0.9254 tCO2e/MWh

Monthly electricity supplied to grid during current monitoring period i.e. from 01/01/2020 to 31/12/2021 is give below:

2020			2021		
$EG_{PJ,2020}$	13364.39	MWh	$EG_{PJ,2021}$	10680.01	MWh

Hence, baseline emission for year 2020

BE_{2020} = 13364.39 x0.9254 = 12367.54 tCO2e

BE_{2020} = 12,367 tCO2e (rounded down)

Baseline emission for year 2021

BE_{2021} = 10680.01 x 0.9254 = 9883.28 tCO2e

BE_{2021} = 9,883 tCO2e (rounded down)

Total baseline emission during current monitoring period i.e. 01/01/2020 to 31/12/2021

BE_y= 22,250 tCO2e

5.2 Project Emissions

The diesel consumption during current monitoring period was 1118.29 litres, which results around 3.04 tCO_2e, the project emissions during current monitoring period are calculated as per tool referred in registered PDD using equation below:

$PE_{FC,j,y} = \Sigma FC_{i,j,y} * COEF_{i,y\,i}$

Where:
$PE_{FC,j,y}$ = Are the CO_2 emissions from fossil fuel combustion in process j during the year y (tCO_2/yr)
$FC_{i,j,y}$ = Is the quantity of fuel type i combusted in process j during the year y (mass or volume unit/yr)
$COEF_{i,y\,i}$ = Is the CO_2 emission coefficient of fuel type i in year y (tCO_2/mass or volume unit)
i = Are the fuel types combusted in process j during the year y

$COEF_{i,y} = NCV_{i,y} \times EF_{CO2,i,y}$
Where:

$COEF_{i,y}$ = Is the CO_2 emission coefficient of fuel type i in year y (tCO_2/mass or volume unit)
$NCVi,y$= Is the weighted average net calorific value of the fuel type i in year y (GJ/mass or volume unit)
$EF_{CO2,i,y}$ = Is the weighted average CO_2 emission factor of fuel type i in year y (tCO_2/GJ)

2020			2021		
$FC_{diesel,2020}$	185.36	Liters	$FC_{diesel,2021}$	932.93	Liters
$NCV_{diesel,2020}$	43.3	GJ/Ton	$NCV_{diesel,2021}$	43.3	GJ/Ton
$EF_{CO2,diesel,2020}$	74.8	tCO_2/TJ	$EF_{CO2,diesel,2021}$	74.8	tCO_2/TJ
Density of diesel	0.84	Kg/liter	Density of diesel	0.84	Kg/liter
$COEF_{Diesel,2020}$	=43.3*74.8/10^6 = 0.00323884	tCO_2/Kg	$COEF_{Diesel,2021}$	=43.3*74.8/10^6 = 0.00323884	tCO2/Kg
PE_{2020}	= 185.36*0.00323884 **= 0.5042874** **= 1 (rounded up)**	tCO_2	PE_{2021}	=932.93**0.00323884 **= 2.53814935** **= 3 (rounded up)**	tCO_2
Total Project Emission during Monitoring Period				**4**	**tCO_2**

5.3 Leakage

In line with applied methodology, since the energy generating equipment is not transferred from another activity, leakage is not to be considered. Hence,

LE_y = 0 tCO_2e

5.4 Net GHG Emission Reductions and Removals

Year	Baseline emissions or removals (tCO_2e)	Project emissions or removals (tCO_2e)	Leakage emissions (tCO_2e)	Net GHG emission reductions or removals (tCO_2e)
2020	12367	1	0	12366
2021	9883	3	0	9880
Total	22250	4	0	22246

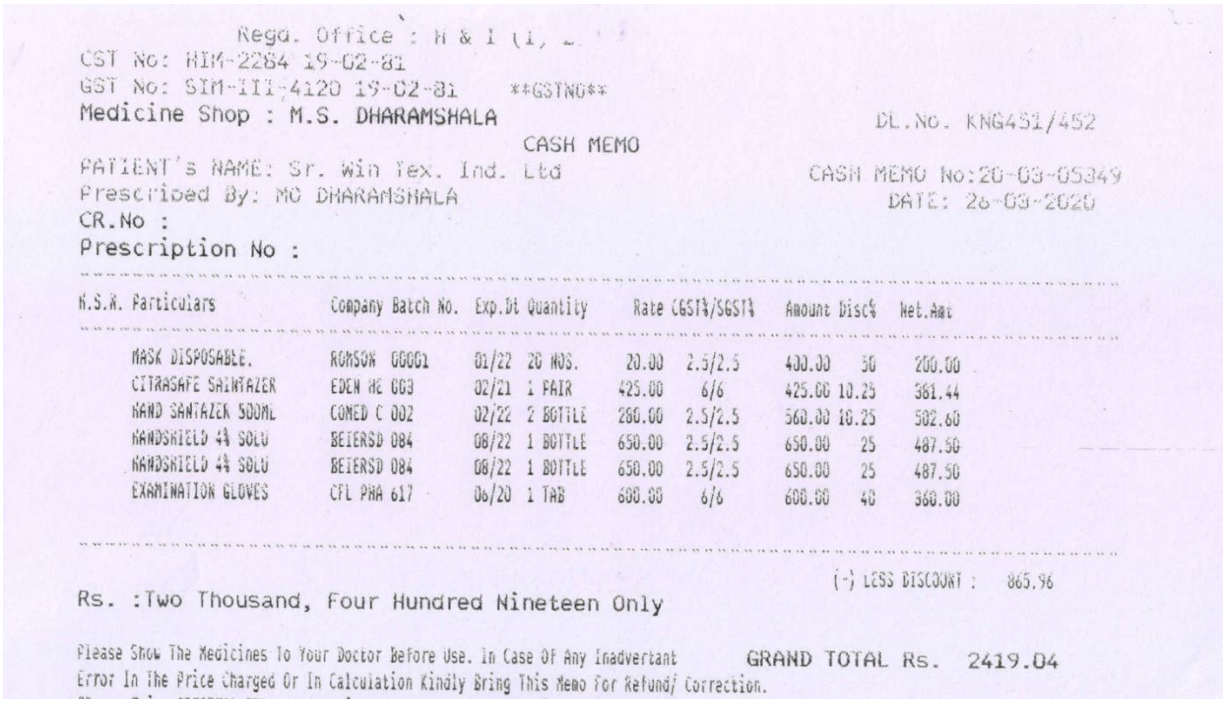

The emission reduction during current monitoring period is lower than ex-ante estimation in registered PD for current monitoring period (731 days) i.e. 35,238 tCO2e.

The actual emission reduction achieved i.e. **22,246 tCO2e** is 36.86% lower than ex-ante estimation for same period due to lower PLF achieved.
