CONTENTS

- A. General description of project activity
- B. Application of a baseline and monitoring methodology
- C. Duration of the project activity / crediting period
- D. Environmental impacts
- E. Stakeholders' comments

Annexes

- Annex 1: Contact information on participants in the project activity
- Annex 2: Information regarding public funding
- Annex 3: Baseline information
- Annex 4: Monitoring plan

**SECTION A. General description of project activity****A.1. Title of the project activity:**

>>

Inner Mongolia Jingneng Saihan Wind Farm Phase I Project

Version number of the document: 3

Date: 23 February 2010

A.2. Description of the project activity:

>>

Inner Mongolia Jingneng Saihan Wind Farm Phase I Project (hereinafter referred to as the proposed project) is to utilize wind resources for electricity generation through the construction of a wind farm with a total capacity of 49.5 MW and a 220 kV substation in Saihantala Town, Suniteyou Qi, Xilinhot City, Xilinguole League, Inner Mongolia Autonomous Region, P.R.China. The proposed project is invested and developed by Beijing International New Energy Co., Ltd. The electricity generated from the project will be sold to West Inner Mongolia Power Grid, an integral part of the North China Power Grid. The estimated annual net electricity output and average annual emission reductions of the proposed project are 124.497 GWh and 131,331tCO₂e, respectively. The proposed project is a grid-connected renewable energy project.

The proposed project makes contribution to the local sustainable development as follows:

1. GHG emission reduction

The proposed project activity will achieve obvious greenhouse gas (GHG) emission reductions by avoiding CO₂ emissions, as grid-connected fossil fuel-fired power dominates in the North China Power Grid.

2. Pollutants emission reduction through replacing fossil fuel combustion

The proposed project is to replace grid-connected fossil fuel-fired power plants in the North China Power Grid, and thus reduce fossil fuel consumption and avoid pollutants emission, such as sulfur dioxide and dust, brought by fossil fuel combustion. Therefore, the proposed project has obvious environmental benefit.

3. Employment opportunities

The conducting of the proposed project will offer 16 job opportunities for local people.

4. Economy Improvement

The construction of the wind farm will achieve the economy development in the region. Furthermore, the project will contribute to local government with more tax revenues and poverty eradication.

A.3. Project participants:

>>

Please list project participants and Party(ies) involved and provide contact information in Annex 1. Information shall be indicated using the following tabular format.

Name of Party involved (*) (host) indicates a host	Private and/or public entity(ies)	Kindly indicate if the Party involved
---	--------------------------------------	--

Party)	project participants (as applicable)	wishes to be considered as project participant (Yes/No)
People's Republic of China (host)	Beijing International New Energy Co., Ltd.	No
UK	OneCarbon International B.V.	No
(*) In accordance with the CDM modalities and procedures, at the time of making the CDM PDD public at the stage of validation, a Party involved may or may not have provided its approval. At the time of requesting registration, the approval by the Party(ies) involved is required.		

Further contact information of project participants is provided in Annex 1.

A.4. Technical description of the project activity:

A.4.1. Location of the project activity:

A.4.1.1. Host Party(ies):

>>

People's Republic of China

A.4.1.2. Region/State/Province etc.:

>>

Inner Mongolia Autonomous Region

A.4.1.3. City/Town/Community etc.:

>>

Saihantala Town, Suniteyouqi, Xilinhot City, Xilinguole League

A.4.1.4. Detail of physical location, including information allowing the unique identification of this project activity (maximum one page):

>>

The proposed project is located at Saihantala Town, Suniteyouqi, Xilinhaote City, Xilinguole League, Inner Mongolia Autonomous Region, P. R. China. The project has geographical coordinates with east longitude of 112°49'36.88" and north latitude of 42°34'23.24". Figures A1 and A2 show the geographical location of the proposed project.

Figure A1. The location of the proposed project on the map of P. R. China

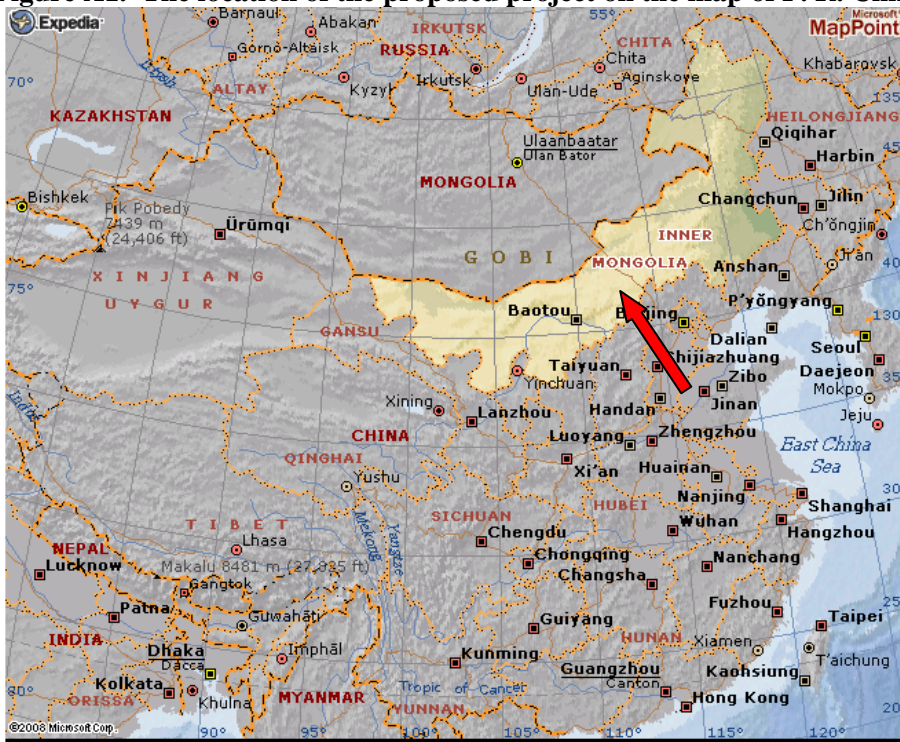

Figure A2. The location of the proposed project on the map of Xilinguole League

**A.4.2. Category(ies) of project activity:**

>>

Category: Renewable electricity in grid-connected applications

Sectoral Scope: 1 Energy industries

A.4.3. Technology to be employed by the project activity:

>>

The proposed project involves the installation of 30 wind turbines with each capacity of 750 kW and 18 wind turbines with each capacity of 1500 kW, which amounts to a total installed capacity of 49.5 MW. The load factor of the proposed project is 0.29, the annual net electricity output is 124.497 GWh and the annual full operational time is 2515 h. The wind turbines will be supplied by Goldwind Science and Technology Co., Ltd which is a domestic manufacturer and the selected model is Goldwind S50/750kW and Goldwind 77/1500kW. The main technical specifications of the wind turbine are provided in the following table.

Goldwind S50/750kW technical specifications

Item	Unit	Index
Rated capacity	kW	750
Number of blades		3
Rotor diameter	m	50
Swept area	m ²	1963.5
Rotor Speed	r/min	21.7
Cut-in speed	m/s	3.5
Rated wind speed	m/s	14-15
Safe wind speed	m/s	70
Cut-out speed	m/s	25
Height of tower	m	50
Rated voltage of generator	V	690
Rated capacity of generator	kW	750

Goldwind 77/1500kW technical specifications

Item	Unit	Index
Rated capacity	kW	1500
Number of blades		3
Rotor diameter	m	77
Swept area	m ²	4657
Cut-in speed	m/s	3
Rated wind speed	m/s	11
Safe wind speed	m/s	59.5
Cut-out speed	m/s	22
Height of tower	m	65
Rated voltage of generator	V	690
Rated capacity of generator	kW	1500

A 220kV substation will be set up at the site, which connects the proposed project to the 220kV Wenduer Substation. Then the power produced in the wind farm can be transmitted to the West Inner

Mongolia Power Grid, an integral part of the North China Power Grid. The wind turbines employed in the proposed project is made in domestic, therefore it doesn't involve international technology transfer.

A.4.4. Estimated amount of emission reductions over the chosen crediting period:

>>

A crediting period of 7 years (Mar 2010- Feb 2017, renewable twice) is selected for the project activity. An estimation of emissions reductions expected over the crediting period is provided in the table below¹.

Year	Annual estimation of emission reductions in tonnes of CO₂e
2010 (Mar - Dec)	109,442
2011	131,331
2012	131,331
2013	131,331
2014	131,331
2015	131,331
2016	131,331
2017 (Jan~Feb)	21,889
Total estimated reductions (tonnes of CO₂e)	919,317
Total number of the first crediting years	7
Annual average over the crediting period of estimated reductions (tonnes of CO₂e)	131,331

A.4.5. Public funding of the project activity:

>>

There is no public funding for the proposed project and there is no involvement of the public development funding in Annex 1.

¹ The proposed project is expected to be commissioned and registered in EB by the end of December 2008.

**SECTION B. Application of a baseline and monitoring methodology****B.1. Title and reference of the approved baseline and monitoring methodology applied to the project activity:**

>>

The approved methodology applied in the proposed project activity is ACM0002 (version 07) – “Consolidated methodology for grid-connected electricity generation from renewable sources”.

“Tool for the Demonstration and Assessment of Additionality (version 05.2)” and “Tool to calculate the emission factor for an electricity system (version 01.1)” are also applied in the proposed project.

For more information regarding the methodologies please refer to <http://cdm.unfccc.int/methodologies/PAmethodologies/approved.html>

B.2. Justification of the choice of the methodology and why it is applicable to the project activity:

>>

The proposed project meets all applicability conditions of methodology ACM0002 which are listed as follows:

- 1) The proposed project is a new wind power project;
- 2) The proposed project does not involve switching from fossil fuels to renewable energy at the site;
- 3) The geographic and system boundaries of North China Power Grid to which the proposed project will be connected can be clearly identified and information on the characteristics of the grid is available.

B.3. Description of the sources and gases included in the project boundary

>>

	Source	Gas	Included?	Justification / Explanation
Baseline	Fossil fuel-fired power plants in the North China Power Grid	CO ₂	Yes	Major emission sources
		CH ₄	No	Minor emission source.
		N ₂ O	No	Minor emission source.
Project Activity	The proposed wind power project	CO ₂	No	No GHG emissions from wind power projects.
		CH ₄	No	Excluded according to methodology.
		N ₂ O	No	Excluded according to methodology.

The spatial extent of the project boundary includes Inner Mongolia Jingneng Saihan Wind Farm Phase I Project site. The project site includes the power plants, turbines themselves and auxiliary electric equipments that are used to support the turbines operation. The Inner Mongolia Jingneng Saihan Wind Farm Phase I Project is connected to the North China Power Grid (NCPG) and the NCPG including all power plants connected is selected as the project boundary therefore.

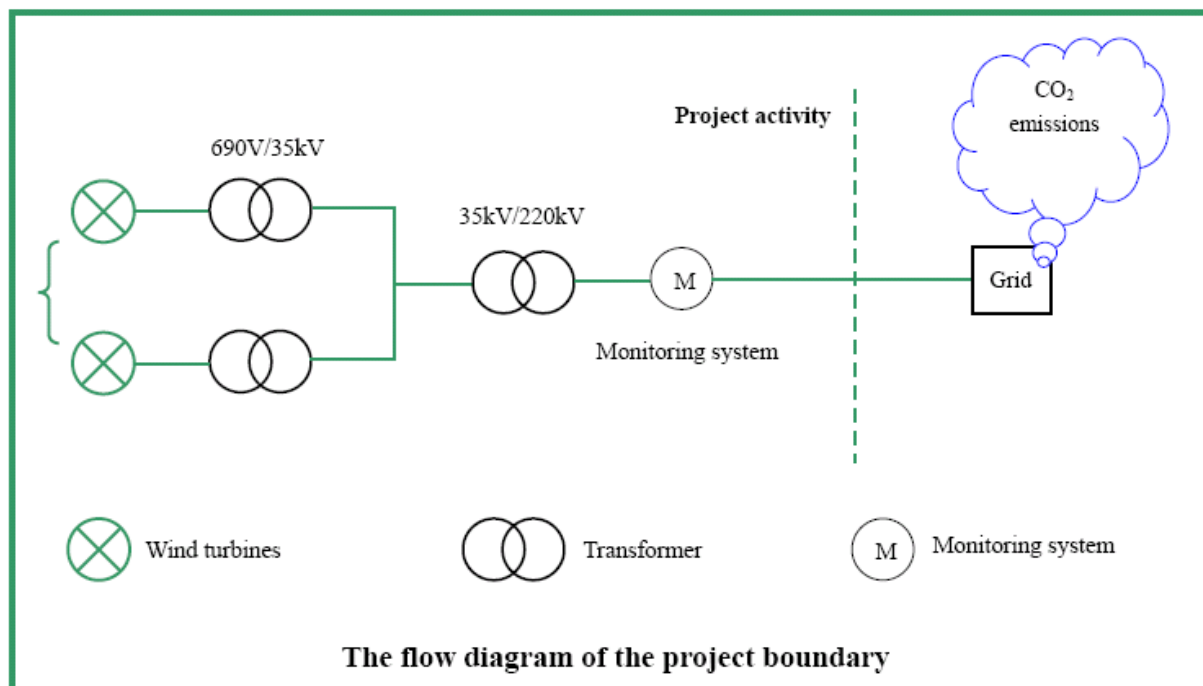

The NCPG is the project electricity system, which is defined by the spatial extent of the power plants that can be dispatched without significant transmission constraints. In determining this project

electricity system, such causes below are taken into account.

Using the boundary definitions published by the Chinese DNA², the NCPG consists of Beijing, Tianjin, Hebei, Shanxi, Shandong and Inner Mongolia Power Grids. The electricity transmission between different provinces in the North China Power Grid is large. The electricity transmission among the North China Power Grid and the other grids are very insignificant³. Hence, it is reasonable for the proposed project to regard the North China Power Grid as the project boundary.

In April 2002, China implemented the policy of "separate power plants from grids and compete in price for grid connection". The power sector reform started in 2002, and the six big power grids structured from then. Hence the grid data from Year 2004, 2005 and 2006 of the North China Power Grid applied in the PDD, which is after the power sector reform in China.

The flow diagram of the project boundary is illustrated as below:

B.4. Description of how the baseline scenario is identified and description of the identified baseline scenario:

>>

² Source: <http://cdm.ccchina.gov.cn/english/NewsInfo.asp?NewsId=2871>

³ The electricity import and output between North China Power Grid and other grids (Northeast China Power Grid) is very insignificant and not necessary to be considered when calculating EF of grid. According to China Electric Power Yearbook 2006, North China Power Grid imported 23,423,000MWh power from Northeast China Power Grid in 2005, but the total power supply of North China Power Grid is 560,751,013MWh. (Source: The data from *China Electric Power Yearbook 2006* for the calculation of OM issued on <http://cdm.ccchina.gov.cn/english/NewsInfo.asp?NewsId=2871>)

In absence of the proposed project, reasonable and credible alternatives to the proposed project include:

- 1) The proposed project not undertaken as CDM project;
- 2) Construction of a fossil fuel power plant with equivalent amount of annual electricity output;
- 3) Construction of a power plant using other sources of renewable energy with equivalent amount of annual electricity output; and
- 4) Supply of equivalent annual power output by the Grid to which the proposed project is connected.

Specific analysis on the four alternative scenarios in absence of the proposed project is as follows:

- 1) According to the investment analysis in Section B.5, the IRR of total investment of the proposed project is only 6.31%. The development of the proposed project under fully commercialized conditions without CDM could not be financially attractive. Therefore, the Scenario 1 is not a feasible alternative.
- 2) The alternative fossil fuel-fired power plant for the proposed project would be less than 135MW. However, fossil fuel-fired power plant with a capacity of 135MW or less is strictly prohibited in large grids, such as provincial grids⁴. Furthermore, the manufacturing and construction of fossil fuel-fired generators of 100MW or less in small (detached) grid are strictly controlled⁵. Consequently, Scenario 2 is ruled out from being a feasible alternative.
- 3) Solar PV, geothermal, biomass and hydropower are the possible grid-connected renewable energy options that could be applied in the North China Power Grid besides wind energy. Limited by the status of technological advancement and high investment costs, solar PV, geothermal and biomass options are far from being economically attractive. And because of the lack of usable hydro resources in North China and the fact that proposed project is located on desert grassland with little biomass resources, both the hydropower and biomass options are less attractive within the project boundary. Hence, Scenario 3 is not a feasible alternative.
- 4) The installed capacity of North China Power Grid has been continuously increasing over the past. Moreover, this alternative complies with all applicable laws and is economically viable. Therefore, Scenario 4 is a feasible alternative baseline scenario.

As a result of the above discussion, electricity supply of equal amount as the proposed project from the North China Power Grid is selected as the baseline for the proposed project.

B.5. Description of how the anthropogenic emissions of GHG by sources are reduced below those that would have occurred in the absence of the registered CDM project activity (assessment and demonstration of additionality):

>>

Notice on Strictly Prohibiting the Installation of Fuel-fired Generation with the Capacity of 135MW or below issued by the General Office of the State Council, Decree No. [2002]6

⁵ Source: <http://www.people.com.cn/item/flfgk/gwyfg/1997/220010199708.html>

Notice on Strictly Controlling the Manufacturing and Construction of Small-scale Fuel-fired Generators, Ref. No. [Jijiqing (1995) 2372]

09/2007	Completion of the Feasibility Study Report (FSR)	
13/11/2007		Board meeting made decision to seek CDM support
29/11/2007		CDM Consultancy Contract signed
22/12/2007	Wind turbine purchasing contract signed	
22/01/2008	FSR approved	
14/04/2008		ERPA signed
06/2008	Wind turbine installation contract signed	
19/08/2008		Validation contract signed
23/09/2008		PDD made for public comments
02/2009		UK LoA issued
03/2009		Chinese LoA issued

The Feasibility Study Report (FSR) was completed in September 2007. Realized the price gap between the target tariff (0.585 RMB/kWh) aiming at the project IRR up to the benchmark of 8% and the actual tariff (0.51 RMB/kWh) approved by NDRC in other local wind power projects, the project owner, Beijing International New Energy Co. Ltd., decided to find a consultancy to develop the proposed project as a CDM project activity on the Board meeting. On 29 November 2007, Easy Carbon Consultancy Co., Ltd signed the contract and started the CDM application process. The Wind Turbine Purchase Agreement was signed on 22 December 2007 between the project developer and wind turbine supplier. The wind turbine installation contract was signed in May 2008. According to the EB's guidance on prior consideration of the CDM, the time of wind turbine purchase contract (22 December 2007) was considered as the starting date of the proposed project.

After the project started, the ERPA and validation contract was signed successively to secure the CDM status. The UK LoA was issued in February 2009, and the Chinese LoA was issued on March 2009.

The additionality of the proposed project is demonstrated and assessed by the approved "Tool for the Demonstration and Assessment of Additionality" (Version 05.2). Following steps include:

Step 1. Identification of alternatives to the project activity consistent with current laws and regulations

Define realistic and credible alternatives to the project activity(ies) that can be (part of) the baseline scenario through the following sub-steps:

Sub-step 1a. Define alternatives to the project activity:

Identify realistic and credible alternative(s) available to the project participants or similar project developers that provide outputs or services comparable with the proposed CDM project activity. These alternatives are to include:

- 1) The proposed project not undertaken as CDM project;
- 2) Construction of a fossil fuel power plant with equivalent amount of annual electricity output;
- 3) Construction of a power plant using other source of renewable energy with equivalent amount of annual electricity output; and
- 4) Supply of equivalent annual power output by the Grid to which the proposed project is connected.

Solar PV, geothermal, biomass and hydropower are the possible grid-connected renewable energy options that could be applied in the North China Power Grid besides wind energy. Limited by the status of technological advancement and high investment costs, solar PV, geothermal and biomass options are far from being economically attractive. And because of the lack of usable hydro resources in North China and the fact that proposed project is located on desert grassland with little biomass resources, both the hydropower and biomass options are less attractive within the project boundary. Hence, Scenario 3 is not a feasible alternative.

Sub-step 1b. Consistency with mandatory laws and regulations:

There is a large difference between thermal power and wind farm in their annual operating hours and the stability of their operation. However, an alternative fossil fuel power plant that can provide the equivalent generation capacity with a comparable annual utilization rate of 5,612 hours (Reference: P 626 2007 China Electric Power Yearbook), which was the average utilization hours of the thermal units in China in 2006, would be one with installed capacity of less than 17MW. The alternative fossil fuel power plant with the equivalent power output as the proposed project will be less than 135MW, while coal-fired plants with a capacity of 135MW or less are prohibited from development in large grid such as provincial grids⁶, and the fossil fuel-fired power units with less than 100MW capacity is strictly regulated for installation⁷ according to current regulations in China. Consequently, alternative 2) is not a feasible alternative.

The alternative 1), 3) and 4) are in line with the existing Chinese laws and regulations.

However, for the alternative 3), limited by the status of technological advancement and high investment costs, solar PV, geothermal and biomass options are far from being economically attractive. Only hydropower is comparable to wind power in China. However, the proposed project location is located at desert steppe, where lacks of rainfall and suffers cold winter, thus the usable waterpower resource for developing is not available. Hence; Scenario 3) is not a feasible alternative.

Step 2. Investment analysis

The purpose of this step is to determine whether the proposed project activity is economically or financially less attractive than other alternatives without an additional funding that may be derived from the CDM project activities. The investment analysis was conducted in the following steps:

Sub-step 2a. Determine appropriate analysis method

The three analysis methods suggested by *Tools for the demonstration and assessment of additionality* are simple cost analysis (Option I), investment comparison analysis (Option II) and benchmark analysis (Option III). Since the proposed project will earn revenues from not only the CDM but also the electricity output, the simple cost analysis method is not appropriate. Investment comparative analysis method is only applicable to the case that alternative baseline scenario is similar to the proposed projects, so that comparative analysis can be conducted. The baseline scenario of the proposed project is to supply equivalent annual power output from the North China Power Grid rather

⁶ Notice on Strictly Prohibiting the Installation of Fuel-fired Generation with the Capacity of 135MW or below issued by the General Office of the State Council, decree no. 2002-6

⁷ Notice on Strictly Controlling the Manufacturing and Construction of Small-scale Fuel-fired Generators, Ref. No.[Jijiqing (1995) 2372]

than a new investment project. Therefore, Option II is not an appropriate method either. The proposed project will use benchmark analysis method based on Project IRR.

Sub-step 2b. Apply benchmark analysis (Option III)

With reference to *Interim Rules on Economic Assessment of Electric Engineering Retrofit Projects*, the financial benchmark IRR of Chinese electricity industry is 8% on Project (after tax), which has been used widely in feasibility studies of new power plants, including wind power projects in China.

Sub-step 2c. Calculation and comparison of financial indicators

Based on the above-mentioned benchmark, the calculation and comparative analysis of financial indicators for the proposed project are carried out in sub-step 2c.

(1) Basic parameters for calculation of financial indicators

Based on the Feasibility Study Report of the proposed project, basic parameters for calculation of financial indicators are as follows:

<i>Parameter</i>	<i>Data</i>	<i>Source</i>
Installed capacity	49.5 MW	Page 14-4 of the FSR
Annual output	124.497 GWh	Page 14-4 of the FSR
Project lifetime	20 years	Page 14-1 of the FSR
Total investment	515.14 million RMB	Page 14-6 of the FSR
Annual O&M cost	10.69 million RMB	Average value calculated according to the Total Cost Estimating Table on Page 14-14 and 14-15 of the FSR
Tariff	0.51 RMB/kWh (Incl. VAT)	Referenced from other projects approved by NDRC within the same region
Depreciation period	15 years	Page 14-1 of the FSR
Residual	5%	Page 14-13 of the FSR
Tax rate	8.5% (VAT)	Page 14-2 of the FSR
	25% (Income tax)	
	5% (City tax)	
	3% (Education tax)	
Expected CERs price	12 Euro/tCO _{2e}	Project developer

Justification on the appropriate of the tariff applied to the proposed project

Before the implementation of a wind farm project, the on-grid tariff of the project can only be estimated based on the already issued on-grid tariff of similar wind farms in the same region. The electricity generated by the proposed project will be supplied to Inner Mongolia Power Grid, and then the North China Power Grid. Furthermore, in the on-grid tariff of wind farms issued by National Development & Reform Commission (NDRC) were determined according to the provincial level. Hence, the Inner Mongolia Power Grid is defined as the reference region.

NDRC has issued the notifications about on-grid tariff of wind farm projects in Inner Mongolia on 22nd December 2006⁸, 9th June 2007⁹, 3rd December 2007¹⁰, 23rd July 2008¹¹ and 20th July 2009¹², respectively. The details of the on-grid tariff in Inner Mongolia issued by NDRC were listed in the following table.

Date	Code of Tariff Notification	Tariff issued in the Notification (RMB Yuan/kWh, including VAT)	Remarks
22 nd December 2006	Fagaijiage [2006] No.2908	0.579	Issued for Inner-Mongolia Ximeng Abag 49.5MW Wind Power Project
		0.5497	Issued for Inner Mongolia Wulatezhongqi Wind Farm Project
		0.548	Issued for Inner Mongolia Bailingmiao Wind Farm Project
9 th June 2007	Fagaijiage [2007] No.1260	0.51	Issued for Inner Mongolia Datang Zhuozi Wind Farm
3 rd December 2007	Fagaijiage [2007] No.3303	0.51	Issued for 28 projects in Inner Mongolia
23 rd July 2008	Fagaijiage [2008] No.1876	0.51	Issued for 6 projects in Inner Mongolia
20 th July 2009	Fagaijiage [2009] No.1906	0.51	Issued for the wind farm projects approved after 1 st August 2009.

When the the project owner was making the decision whether to implement the proposed project or not, the tariff of wind farm projects in Western Inner Mongolia issued by NDRC¹³ on 9th June 2007 was used as the latest tariff policy available, which is 0.51 RMB Yuan/kWh (including VAT).

(2) Comparison of IRR for the proposed project and the financial benchmark

In accordance with the benchmark analysis (Option III), the proposed project will not be considered as financially attractive if its financial indicators (such as IRR) are lower than the benchmark.

Table 1 shows the IRRs of the proposed project, with and without CDM-related income. Without CDM-related income, the Project IRR is lower than the benchmark and the proposed project is not

¹² Source: Fagaijiage [2009] No.1906. website: http://www.sdpc.gov.cn/zcfb/zcfbtz/2009tz/t20090727_292827.htm

¹³ Fagaijiage [2007] No.1260. The document has been provided to DOE for validation.

financially acceptable. With it, the Project IRR is better than the benchmark and therefore, the proposed project is financially acceptable.

Table 1. Financial indicators of the Proposed Project

	Project IRR (benchmark= 8%)
Without CDM-related income	6.31%
With CDM-related income	9.80%

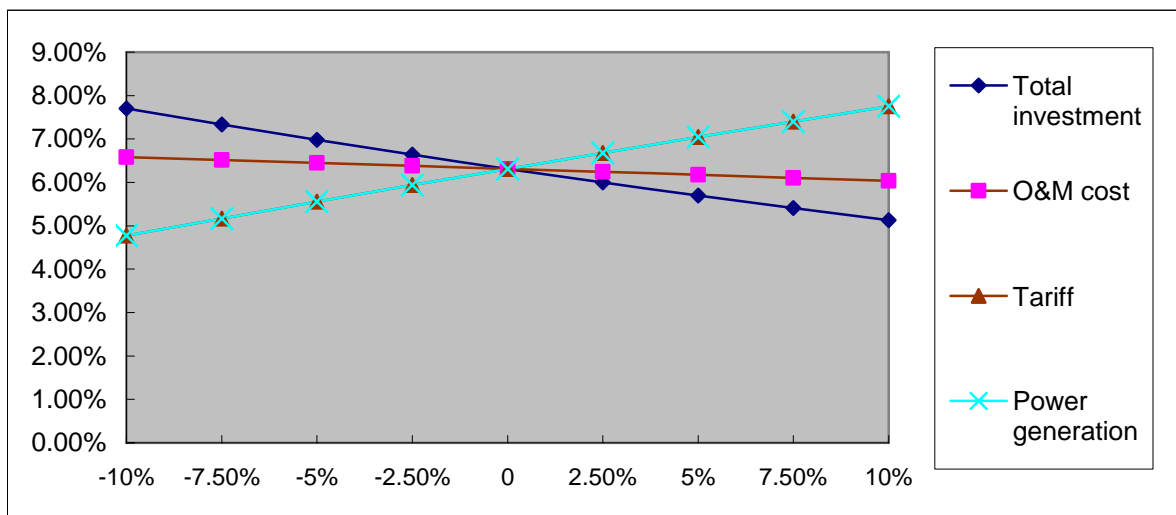

Sub-step 2d. Sensitivity analysis (only applicable to options II and III):

To show that the conclusion regarding the financial attractiveness of the proposed project is robust to reasonable variations of the critical assumptions, four financial parameters, i.e. total investment, annual O&M cost, tariff and power generation are chosen for sensitive analysis. The chosen financial parameters are assumed to vary within a reasonable range from -10% to +10%, and accordingly, the Project IRR (after tax and without CDM-related income) varies to different extents, as shown in Table 2 and Figure 2.

Table 2. Sensitivity of Project IRR to different financial parameters

Parameter	Range								
	-10%	-7.50%	-5%	-2.50%	0%	2.50%	5%	7.50%	10%
Total investment	7.70%	7.33%	6.98%	6.64%	6.31%	6.00%	5.70%	5.41%	5.13%
O&M cost	6.58%	6.52%	6.45%	6.38%	6.31%	6.24%	6.18%	6.11%	6.04%
Tariff	4.78%	5.17%	5.56%	5.94%	6.31%	6.68%	7.04%	7.40%	7.75%
Power generation	4.78%	5.17%	5.56%	5.94%	6.31%	6.68%	7.04%	7.40%	7.75%

Figure 2. Sensitivity of Project IRR to different financial parameters

As shown in Table 2 and Figure 2, the Project IRR of the proposed project varies to different extents, when the above four financial indicators fluctuated within the reasonable range from -10% to +10% and the Project IRR does not exceed the benchmark of 8%.

The total investment needs to decrease by 12% when the Project IRR meets the benchmark of 8%. Due to the increasing pricing level of construction materials and equipments as well as manpower, the total investment of the proposed project is impossible to be decreased by over 12% to exceed benchmark.

The annual O&M cost needs to decrease by 64% when the Project IRR meets the benchmark of 8%, which is impossible.

The tariff needs to increase by 11.8%, which is as high as 0.57 RMB/kWh (Incl. VAT), when the Project IRR meets the benchmark of 8%. According to the approved tariff of wind power projects with the same region these years, 0.51 RMB/kWh (Incl. VAT) will be fixed for 30,000 hours of full load generation of wind farms, after that, the tariff will be down to the average tariff of local thermal power plants in NCPG, currently it is 0.2749 RMB/kWh (Incl. VAT)¹⁴, which is much lower. Considering the annual full operation hours of the proposed project around 2000 hours, 0.51 RMB/kWh (Incl. VAT) will be fixed for about 15 years. To be conservative, the PDD uses 0.51 RMB/kWh (Incl. VAT) for financial analysis of the whole lifetime. Therefore, it is impossible that the tariff of the proposed project could increase by 11.8%.

The power generation needs to increase by 11.8% when the Project IRR meets the benchmark of 8%. For the proposed project, the power generation is calculated based on the monitored data of the local wind resources over 30 years. The annual generation represents a long-term average power supply throughout the lifetime of wind farm, where the yearly-variations have already been taken into account. Therefore, the power generation of the proposed project is impossible to decrease by 11.8% to exceed benchmark.

In conclusion of the sensitive analysis, as the financial indicators vary within reasonable range, the proposed project remains financially unacceptable without CDM support. Therefore, Scenario 1 is not a feasible alternative.

Step 4. Common practice analysis

Sub-step4a. Analyze other activities similar to the proposed project activity:

In April 2002, China implemented the policy "Separate power plants from network and compete in price to enter network". The objective of this power sector reform is to establish a more commercialized power market in China. Power project investment has to be under a more commercialized condition and considers project investment return more seriously. Since market condition for wind power project development changes much since 2002, this common practice analysis starts from April 2002.

According to the methodology ACM0002, projects with installed capacity of or below 15MW belongs to small scale projects, hence, this common practice analysis compares projects larger than 15MW.

Inner Mongolia Autonomous Region is the largest region of wind resources in China. And it also has the most wind power projects in the country. So it is chosen as the similar area.

¹⁴ Source: http://www.ndrc.gov.cn/zcfb/zcfbtz/2008tongzhi/t20080702_222220.htm

Table 3 shows the similar projects (larger than 15MW and within Inner Mongolia Autonomous Region) that have commissioned since 2002 without CDM support.

Table 3 Wind Farm Development within Inner Mongolia Autonomous Region¹⁵

Project	Commissioned in	Total capacity (MW)	Project developer	Remark
Dali Phase III Wind Farm Project ¹⁶	2004	31.2 MW	East Power Maolin Wind Resources Development Co., Ltd.	Demonstration Project supported by national debt fund
Da Mao Qi Bailingmiao Wind Farm Project ¹⁷	2008	35	Hongteng Energy	Invested by foreign investors and validated as a VER project under Golden Standard program

Sub-step 4b. Discuss any similar options that are occurring:

As shown in Table 3, within Inner Mongolia Autonomous Region, there are only two projects named Dali Phase III Wind Farm Project and Da Mao Qi Bailingmiao Wind Farm Project with the similar capacity (larger than 15 MW) as the proposed project and has been put into operation since April 2002 without CDM support. The Dali Phase III Wind Farm Project is a demonstration project and is supported by national debt fund. With the national debt fund, it is more financially viable than the proposed project. And the Da Mao Qi Bailingmiao Wind Farm Project is invested by foreign investors and has been validated as a VER project under Golden Standard program. Therefore, there's essential distinction between the projects above and the proposed project.

As stated above, it is concluded that the proposed project is not common practice within the region.

Therefore, the proposed project is additional.

B.6. Emission reductions:

B.6.1. Explanation of methodological choices:

>>

The GHG emission calculation of the proposed project was based on the instruction of "Tool to calculate the emission factor for an electricity system (version 01.1)". All the data employed in the

¹⁵ Source: <http://www.gsec.gov.cn/ClassNews.asp?newsID=664>

Statistic of Installed Capacity of China's Wind Farms in 2007 issued by Chinese Wind Energy Association

¹⁶ Source: <http://cangzhou.mofcom.gov.cn/column/print.shtml?/sjhbohaisq/200605/20060502338640>

¹⁷ Source: <http://china.camcoglobal.com/zh/chinacastudyview.obyx?cs=honiton.html>

calculation is based on the available data from North China Power Grid¹⁸. The baseline emission factor (EF_y) is calculated as a combined margin (CM), consisting of the combination of operating margin (OM) and build margin (BM) factors according to the following three steps (OM and BM of the proposed project has been pre-determined):

Step 1. Identify the relevant electric power system

The DNA of the host country has published a delineation of the project electricity system and connected electricity systems, this delineation is used. The project electricity system is the North China Power Grid, which consists of Beijing, Tianjin, Hebei, Shanxi, Shandong and Inner Mongolia Autonomous Region Power Grids.

The connected power grids are: (i) the Northeast China Power Grid, which consists of Jilin, Liaoning and Heilongjiang provincial grids; (ii) the Central China Power Grid, which consists of Henan, Hubei, Hunan, Jiangxi, Sichuan provincial grids and Chongqing municipal grid. Considering there is electricity transferring from the connected power grid to the North China Power Grid, the CO₂ emission factor(s) of net electricity imports ($EF_{grid,import,y}$) from the connected electricity system should be determined using one of the following options for the purpose to determine the operating margin emission factor:

- (a) 0 tCO₂/MWh, or
- (b) The weighted average operating margin (OM) emission rate of the exporting grid, determined as described in step 3 (d) below; or
- (c) The simple operating margin emission rate of the exporting grid, determined as described in step 3 (a), if the conditions for this method, as described in step 2 below, apply to the exporting grid; or
- (d) The simple adjusted operating margin emission rate of the exporting grid, determined as described in step 3 (b) below.

Option (b) is chosen to calculate the CO₂ emission factor(s) of net electricity imports ($EF_{grid,import,y}$).

Considering the electricity imports from the Northeast China Power Grid and Central China Power Grid to the North China Power Grid didn't change significantly from 2004 to 2006, the spatial extent is limited to the project electricity system according to the tool for the purpose to determine the operating margin emission factor.

Step 2. Select an operating margin (OM) method

The calculation of the operating margin emission factor ($EF_{grid,OM,y}$) is based on the following methods:

¹⁸ Source: China Power Yearbook 2005-2007, China Energy Statistical Yearbook 2005-2007

- (a) Simple OM, or
- (b) Simple adjusted OM, or
- (c) Dispatch Data Analysis OM, or
- (d) Average OM.

Without any nuclear source, the North China Power Grid only possesses 0.745% of its total electricity generation that comes from renewable energy sources in 2006, 0.749% in 2005, 0.708% in 2004, 0.862% in 2003, 0.889% in 2002 and 0.811% in 2001⁷. Hence, the electricity generated from the low operating cost/must run sources is much less than 50% of the total grid generation, which accords with the defined condition of Option A, but not Option D. Consequently, Simple OM method is selected to calculate the Operating Margin emission factor of the proposed project.

Consequently, Simple OM method is selected to calculate the Operating Margin emission factor of the proposed project.

Step 3. Calculate the operating margin emission factor according to the selected method

The Simple OM emission factor is calculated as the generation-weighted average CO₂ emissions per unit net electricity generation (tCO₂/MWh) of all generating power plants serving the system, not including low-cost / must-run power plants / units. The data adopted in the proposed project comes from DNA of China. It may be calculated:

- Based on data on fuel consumption and net electricity generation of each power plant / unit (Option A), or
- Based on data on net electricity generation, the average efficiency of each power unit and the fuel type(s) used in each power unit (Option B), or
- Based on data on the total net electricity generation of all power plants serving the system and the fuel types and total fuel consumption of the project electricity system (Option C).

For the proposed project activity, the required data for the exercise of Option A and B are not available and those of Option C can be obtained from official sources, and therefore, Option C is chosen to calculate the operating margin emission factor.

$$EF_{grid,OMsimple,y} = \frac{\sum_{i,m} FC_{i,y} \cdot NCV_{i,y} \cdot EF_{CO_2,i,y}}{\sum_m EG_y}$$

Where:

- EF_{grid,OMsimple,y} = Simple operating margin CO₂ emission factor in year y (tCO₂ /MWh)
- FC_{i,y} = Amount of fossil fuel type *i* consumed in the project electricity system in year y (mass or volume unit)

⁷ China Electric Power Yearbook 2002-2007

NCV _{i,y}	= Net calorific value (energy content) of fossil fuel type <i>i</i> in year <i>y</i> (GJ / mass or volume unit)
EF _{CO₂,i,y}	= CO ₂ emission factor of fossil fuel type <i>i</i> in year <i>y</i> (tCO ₂ /GJ)
EG _y	= Net electricity generated and delivered to the grid by all power sources serving the system, not including low-cost / must-run power plants / units, in year <i>y</i> (MWh)
<i>i</i>	= All fossil fuel types combusted in power sources in the project electricity system in year <i>y</i>
<i>y</i>	= The three most recent years for which data is available at the time of submission of the CDM-PDD to the DOE for validation

Step 4. Identify the cohort of power units to be included in the build margin

The sample group of power units *m* used to calculate the build margin consists of either:

- The set of five power units that have been built most recently, or
- The set of power capacity additions in the electricity system that comprise 20% of the system generation (in MWh) and that have been built most recently.

Project participants should use the set of power units that comprises the larger annual generation.

However, it is very difficult to obtain the data of the five power plants built most recently because these data are considered as confidential information by the company itself and the Grid in China. Therefore, a deviation approved by the EB is applied here in the calculation that is to calculate the new capacity additions and the proportion of each technology of power generation. Then the weighing of capacity additions of different technologies will be worked out. Finally the emission factor will be calculated by employing the efficiency factor representing the best technology commercially available.

Step 5. Calculate the build margin emission factor

The data adopted in the proposed project comes from DNA of China. The build margin emission factor is the generation-weighted average emission factor (tCO₂/MWh) of all power units *m* during the most recent year *y* for which power generation data is available, calculated as follows:

$$EF_{grid, BM, y} = \frac{\sum_m EG_{m, y} \times EF_{EL, m, y}}{\sum_m EG_{m, y}}$$

Where:

EF _{grid, BM, y}	= Build margin CO ₂ emission factor in year <i>y</i> (tCO ₂ /MWh)
EG _{m, y}	= Net quantity of electricity generated and delivered to the grid by power unit <i>m</i> in year <i>y</i> (MWh)
EF _{EL, m, y}	= CO ₂ emission factor of power unit <i>m</i> in year <i>y</i> (tCO ₂ /MWh)
<i>m</i>	= Power units included in the build margin
<i>y</i>	= Most recent historical year for which power generation data is available

As discussed in Step 4., a deviation of this method is used to calculate build margin emission factors in China:

Deviated Calculation of Build Margin (BM)

Sub-step 1. Calculation of weights of CO₂ emissions of solid, liquid and gaseous fossil fuels in total emissions for power generation

$$\lambda_{Coal} = \frac{\sum_{i \in COAL, j} FC_{i,j,y} \times EF_{CO2,i,y}}{\sum_{i,j} FC_{i,j,y} \times EF_{CO2,i,y}}$$

$$\lambda_{Oil} = \frac{\sum_{i \in OIL, j} FC_{i,j,y} \times EF_{CO2,i,y}}{\sum_{i,j} FC_{i,j,y} \times EF_{CO2,i,y}}$$

$$\lambda_{Gas} = \frac{\sum_{i \in GAS, j} FC_{i,j,y} \times EF_{CO2,i,y}}{\sum_{i,j} FC_{i,j,y} \times EF_{CO2,i,y}}$$

Where:

$FC_{i,j,y}$ = Amount of fossil fuel type i consumed in province j in year y (mass or volume unit)

$EF_{CO2,i,y}$ = CO₂ emission factor of fossil fuel type i in year y (tCO₂ /GJ)

COAL, OIL and GAS refer to the group of solid, liquid, and gaseous fossil fuels, respectively.

Sub-step 2: Calculation of Emission Factor of Relevant Thermal Power

$$EF_{Thermal} = \lambda_{Coal} \times EF_{Coal,Adv} + \lambda_{Oil} \times EF_{Oil,Adv} + \lambda_{Gas} \times EF_{Gas,Adv}$$

Where:

$EF_{Coal,Adv}$, $EF_{Oil,Adv}$ and $EF_{Gas,Adv}$ refer to the emission factors representing best technologies commercially available for coal, oil and gas fired power plants, respectively.

Sub-step 3: Calculation of BM of the Grid

$$EF_{grid,BM,y} = \frac{CAP_{Thermal}}{CAP_{Total}} \times EF_{Thermal} ,$$

Where:

CAP_{Total} = The total newly added electricity generation capacity (MW)

$CAP_{Thermal}$ = The newly added electricity generation capacity of thermal power (MW)

**Step 6. Calculate the combined margin emission factor**

The combined margin emission factor is calculated as follows:

$$EF_{\text{grid,CM},y} = EF_{\text{grid,OM},y} \times w_{\text{OM}} + EF_{\text{grid,BM},y} \times w_{\text{BM}}$$

Where:

- $EF_{\text{grid,BM},y}$ = Build margin CO₂ emission factor in year y (tCO₂/MWh)
 $EF_{\text{grid,OM},y}$ = Operating margin CO₂ emission factor in year y (tCO₂/MWh)
 w_{OM} = Weighting of operating margin emissions factor (%)
 w_{BM} = Weighting of build margin emissions factor (%)

The default values of w_{OM} and w_{BM} are:

$$w_{\text{OM}} = 0.75 \text{ and } w_{\text{BM}} = 0.25$$

Baseline Emissions are calculated by multiplying the ex-ante Baseline Emission factor by annual power generation.

$$BE_y = EG_y \times EF_{\text{grid,CM},y}$$

Where:

- BE_y = Baseline emissions in year y (tCO₂ /yr)
 EG_y = Electricity supplied by the project activity to the grid (MWh)
 $EF_{\text{grid,CM},y}$ = Combined margin emission factor for grid connected power generation in year y calculated using the latest version of the “Tool to calculate the emission factor for an electricity system”.

Project Emissions

According to the adopted methodology, the project emissions are zero.

Leakage

The project does not consider leakage according to the requirements of methodology applied.

Emission Reductions

The annual emission reductions ER_y for the project activity are calculated as the baseline emissions minus the project emissions. The final GHG emission reductions are calculated as follows:

$$ER_y = BE_y - PE_y - LE_y$$

Where:

- ER_y = Emission reductions in year y (tCO₂e/year)
 BE_y = Baseline emissions in year y (tCO₂e /year)
 PE_y = Project emissions in year y (tCO₂e year)
 LE_y = Leakage emissions in year y (tCO₂e /year)

B.6.2. Data and parameters that are available at validation:

Any comment:	To calculate BM

B.6.3. Ex-ante calculation of emission reductions:

>>

As described in B.3., the emission reductions of the proposed project are calculated as follows:

Baseline emissions

Annual generation (net of auxiliary power i.e. the on-site electricity usage for the operation of the wind farm) is estimated as 124,497MWh.

The project uses the calculation of emission reductions publicized by China's DNA (source: <http://cdm.ccchina.gov.cn:80/english/NewsInfo.asp?NewsId=2190>). The calculation result is as follows:

$$EF_{\text{grid,OM,y}} = 1.1169 \text{ tCO}_2/\text{MWh}$$

$$EF_{\text{grid,BM,y}} = 0.8687 \text{ tCO}_2/\text{MWh}$$

$$EF_{\text{grid,CM,y}} = 1.1169 \times 0.75 + 0.8687 \times 0.25 = 1.0549 \text{ tCO}_2/\text{MWh}$$

$$BE_y = 124,497 \times 1.0549 = 131,331 \text{ tCO}_2\text{e}$$

The ex-ante baseline emission factor: **1.0549 tCO₂/ MWh**

Annual baseline emissions: **131,331 tCO₂e** (details in Annex 3)

Project emissions

According to the baseline methodology ACM0002, the GHG emission of the proposed project within the project boundary is zero, i.e.

$$PE_y = 0$$

**Leakage**

According to the baseline methodology ACM0002, the leakage of the proposed project is not considered,

$$LE_y = 0$$

Project Emission Reductions

$$ER_y = BE_y - PE_y - LE_y$$

The total annual baseline emissions are 131,331 tCO₂.

The total annual project emissions are 0 tCO₂.

The total annual leakage emissions are 0 tCO₂.

$$ER_y = BE_y - PE_y - LE_y = 131,331 - 0 - 0 = 131,331 \text{ tCO}_2$$

The annual emission reductions are estimated to be: 131,331 tCO₂. The proposed project activity is expected to achieve 919,317 tCO₂e of net emission reductions during the first 7-year crediting period.

B.6.4. Summary of the ex-ante estimation of emission reductions:

>>

Year	Estimation of project activity emissions (tonnes of CO ₂ e)	Estimation of baseline emissions (tonnes of CO ₂ e)	Estimation of leakage (tonnes of CO ₂ e)	Estimation of overall emission reductions (tonnes of CO ₂ e)
2010 (Mar - Dec)	0	109,442	0	109,442
2011	0	131,331	0	131,331
2012	0	131,331	0	131,331
2013	0	131,331	0	131,331
2014	0	131,331	0	131,331
2015	0	131,331	0	131,331
2016	0	131,331	0	131,331
2017 (Jan~Feb)	0	21,889	0	21,889
Total (tonnes of CO₂e)	0	919,317	0	919,317

B.7. Application of the monitoring methodology and description of the monitoring plan:**B.7.1. Data and parameters monitored:**

>>

Data / Parameter:	EG _y
Data unit:	MWh
Description:	Net electricity supplied to the Grid by the project activity in year y.
Source of data to be used:	Calculation by $EG_{export,y}$ minus $EG_{import,y}$
Value of data applied	In this PDD, the net electricity delivered to the Grid 124,497 MWh is applied.

for the purpose of calculating expected emission reductions in section B.6.	
Description of measurement methods and procedures to be applied:	The net electricity supplied to the Grid by the proposed project will be calculated through electricity supplied by the project to the grid ($EG_{export,y}$) minus electricity purchased from the Grid ($EG_{import,y}$) at the project site.
QA/QC procedures to be applied:	Power supplied to the grid will be checked by internal verification procedure and electricity sales receipts.
Any comment:	

B.7.2. Description of the monitoring plan:

>>

This Monitoring plan will set out a number of monitoring tasks in order to ensure the complete, consistent, clear and accurate monitoring and the accurate calculation of the emission reduction in the crediting period. This plan is mainly implemented by the project owner with the cooperation of the grid company.

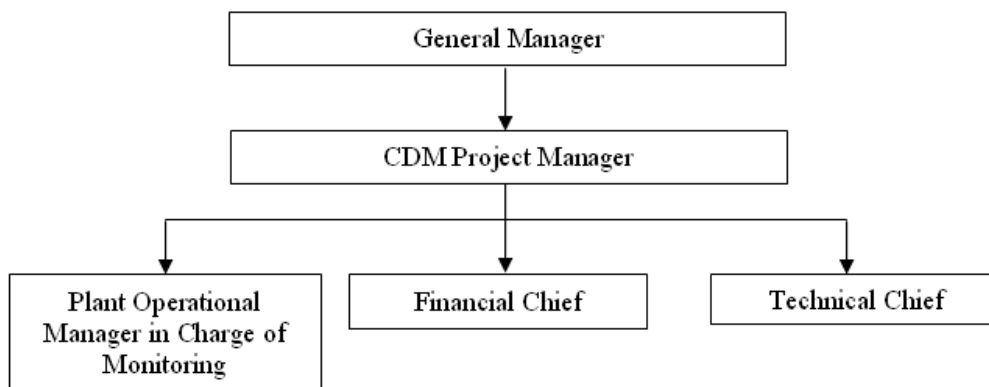

1. Monitoring Object

The main objective data is the power supplied to and purchased from the grid, which is calculated according to the generated electricity and the purchased electricity and supplied to the grid, thus to calculate the emission reduction of the project.

2. Monitoring Implementers

The General Manager of the project entity will appoint a CDM project manager or a chief officer. The operational and monitoring manager of the plant, the Financial Chief, and the Technical Chief are responsible for the collection of the data and information required in the monitoring plan. The collected information will be documented and sent to the CDM manager or responsible staffs of the project entity monthly. The CDM manager will in charge of the implementation of the Monitoring Plan and report to the General Manager of the company. The General Manager of the company will make the confirmations on monitoring, calculation data and reports.

The organization of the monitoring implementers is illustrated in the table below:

3. Monitoring Program and Equipments

Grid-connected electricity generated by the proposed project will be monitored through metering equipment (a meter monitoring both electricity output generated from the proposed project and electricity input provided by the grid) at the substation (interconnection facility connecting the plant to the grid). The meters' precision in this project is 0.2s. At the same time, the data can be monitored and recorded at the on-site control centre using a computer system.

Monitoring equipments includes two meters. The first meter (backup meter) is equipped at the proposed project station and the project owner is responsible for conducting its monitoring. The second meter (main meter) is employed at the substation and the grid company is responsible for conducting the monitoring.

Before the project is in operation, both the project owner and the grid company will check the equipments to ensure their work properly.

4. Data Collection

The verification will use the main meter's data as long as the inaccuracy of the meter is within the permissible tolerance. The main procedures are as follows:

- I According to the requirements of power purchase/sales agreement, the project owner and the grid company should collect the two meters' data periodically, and check them at the same time.
- II The project owner supplies the electricity to the grid company, and provides an electricity sales invoice to the Grid Company. A copy of the invoice is stored by the project owner, together with a record of the payment by the grid company.
- III When the electricity generated by this project cannot meet the electricity requirement of the power plant, the grid company supplies the electricity to the project owner. The Grid Company provides an electricity sales invoice to the project owner and the invoice is stored by the project owner.
- IV The project owner records the power supplied to and purchased from the grid, and hence calculate the net electricity supplied to the grid;
- V The project owner keeps and safe keeps the records of the main meter's data readings for verification by the DOE.

If the fault of the main meter exceeds the allowable tolerance or its malfunction occurs, the grid-connected electricity generated by the proposed project will be resolved by following measures:

- I Adopting the backup meter's data (after taking the line losses into consideration), unless a test by either party reveals it is inaccuracy;
- II If the inaccuracy of the backup meter is not within the acceptable limits or it cannot work properly, the project owner and the grid company shall jointly prepare a new agreement of correct reading;
- III If the project owner and the grid company fail to reach an agreement concerning the correct reading, this matter will be submitted for arbitration according to agreed procedures.

5. Calibration of Meters & Metering

The metering equipment will be properly calibrated and checked annually for accuracy. The project owner will prepare backup procedures to deal with any errors occurred to the meters. The calibration records carried out by the grid company should be provided to the proposed project owner, and these records will be maintained by the proposed project owner and the third party designated.

Meters should be tested by a qualified metric organization co-authorized by the project owner and the grid company within 10 days after:

- I The detection of the reading difference between the main meter and the backup meter that exceeds the allowable tolerance.
 - II The equipments malfunction caused by improper operation
- All the calibration test records should be maintained safely for the verification.

6. Data Management System

To keep safely the record of the data collected during monitoring, this project will set up a complete data management system. The project will perfect the whole monitoring procedure by developing the CDM manual, tracking information from the primary source to the end-data calculations in paper document format. It is the responsibility of the proposed project owner to provide additional necessary data and information for validation and verification requirements of respective DOE. Physical documentation such as paper-based maps, diagrams and environmental assessment will be collated in a central place, together with this monitoring plan. All paper-based information will be stored by the proposed project owner and kept at least one copy.

At the end of each month, the monitoring data will be filed in a spreadsheet and stored on a hard disk and CD-ROM, and the paper-based printout should be also archived. Furthermore, the project owner collects the sales receipts for the electricity supplied to the grid as a cross-check, and compiled the monitoring report including the monitoring data and relevant evidence at the end of each crediting year.

All the data will be kept for two years following the end of the last crediting period.

7. Monitoring Report

After the CDM project manager collects and sorts the monitored data, the monitoring report is prepared by the project developer. The project developer has to make sure that the format and content of the monitoring report are consistent with the monitoring methodology in the registered PDD.

B.8. Date of completion of the application of the baseline study and monitoring methodology and the name of the responsible person(s)/entity(ies)

**SECTION D. Environmental impacts****D.1. Documentation on the analysis of the environmental impacts, including transboundary impacts:**

>>

The environmental impact assessment for this project was carried out by Inner Mongolia Electricity Survey and Design Institute on October 12th 2007 and approved by Inner Mongolia Environmental Protection Bureau on October 23th 2007. A summary of the report is illustrated as below:

Ambient air

The impact on ambient air quality of the proposed project is mainly from dust during the construction phase. The excavation work is the primary emission source, however, it is a ground source and the particle size is quite large so that dust will deposit quickly on the ground. Immediately replant the areas where construction has completed, and sprinkling water on the road frequently should be conducted. Therefore, the proposed project will not pose any threat on the quality of ambient air.

Impact from noise

There is some noise during the operation of wind turbines. The equipments and techniques with lower noise will be chosen to apply. Improvement on construction process and strengthening of equipment maintenance is emphasized. Meanwhile, the project site is very far from the village or resident. Consequently, the noise of operation has little impact to the surrounding environment. As a result, the noise will not impact the work and daily life of local residents.

Electromagnetic impact

The operation of the wind farm will generate electromagnetic pollution, whereas the pollution is slight. In addition, the project is very far from local residents and village. Therefore, the electronic magnetic pollution to the surrounding environment is insignificant.

Impact from Solid waste

Solid wastes generated from the proposed project activity are excavated earth material and municipal solid waste. Part of the excavated earth material will be backfilled, and the rest will be used for land levelling and road construction near the project site. The municipal solid waste will be collected and treated together with the waste from local residents. As the report indicates, solid waste is handled properly.

Impact from Wastewater

Wastewater is mainly domestic wastewater. Wastewater quantity is fairly small and treatment methods will be applied for on-site primary treatment, and then the wastewater will be treated together with the local wastewater. Small-scale septic tanks should be built on the site, through which the wastewater can meet the second degree standard of discharge after treatment. Therefore, the impact of wastewater is limited and mitigated.

Impact on natural environment

In order to protect the landscape, vehicles are prohibited from driving on the landscape randomly and timely afforestation is required; hunting wild animals is strictly forbidden at the same time. The lands permanently taken by wind farms are normally mountain ridges, where most of the vegetation is grass and shrub, without rare plants. Hence, the project construction has little impact on the mountain's eco-environment.

No migrating birds have been found in the project field till now. Therefore, the project is not located on the passage of migrating birds, and the project construction will not influence the migration of birds.

D.2. If environmental impacts are considered significant by the project participants or the host Party, please provide conclusions and all references to support documentation of an environmental impact assessment undertaken in accordance with the procedures as required by the host Party:

>>

The environmental impacts of the Inner Mongolia Jingneng Saihan Wind Farm Phase I Project are not considered as significant.

**SECTION E. Stakeholders' comments****E.1. Brief description how comments by local stakeholders have been invited and compiled:**

>>

The project developer has sent out questionnaires to the stakeholders in the local County for the comments of the proposed project construction in March 18th 2008. 50 copies of questionnaire were distributed, and 47 pieces of reply were received. The recovery ratio is 94%. Among the interviewees, there were 9 farmers, 4 workers, 17 government officials, 3 students, 5 teachers and 9 others. 9 of them have educational level of middle school, 19 of high school, 15 of college, 2 of graduate, and 2 of others. The questions regarding the proposed project were mainly as follows:

1. Is the current living and/or working environment quiet?
2. Do you currently experience electromagnetic interference when watching TV at home?
3. Are there any negative impacts of the proposed project on the everyday life of local residents?
4. Is the proposed project going to help to improve the local economic development?
5. Do you think the construction of the proposed project will have any noise impact on the environment?
6. Which is the environmental topic that concerns you the most during the construction and operation of the proposed project?
7. Do you support the proposed project?

E.2. Summary of the comments received:

>>

The summary of survey is listed as the following:

- 70% of them consider their current living and/or working environment is quiet, another 30% is unsure and only one person think different;
- 75% of them currently do not experience electromagnetic interference when watching TV at home, while other 15% have the experience, and 10% don't know;
- 85% of them think there will not be any negative impacts on their everyday life, and the remainder is unsure;
- 100% of them think the proposed project will help improve local economics
- 62% of them think the construction of the proposed project will have no noise impact on the environment while other 32% is not sure, and three persons think the construction of the proposed project will have noise impact on the environment;
- Regarding the construction and operation of the propose project, 21% of them are most concerned with the noise level, 64% of them are most concerned with electromagnetic interference, and 15% of them are most concerned with wastewater from the project;
- 100% of them support the implementation of the proposed project.

E.3. Report on how due account was taken of any comments received:

>>

The local community possesses basically strong positive comments on the effects of the proposed project. During the survey some people express their concerns about the environmental impacts of the project, local residents were most concerned with noise level, some of them were concerned with electromagnetic interference, and some showed concern about wastewater. As discussed in the EIA report, these issues are well illuminated and specific instructions were given to mitigate the potential

impacts of these issues. For example, the noise level of the advanced wind turbines employed in the proposed project accords with the National Standard. As a result, the noise will not impact the work and daily life of local residents. The level of the electromagnetic energy produced is very low. In addition, the distance between the project location and the local residents is far. Therefore, the electronic magnetic pollution to the surrounding environment is insignificant. Wastewater quantity is fairly small and then the wastewater will be removed periodically. Therefore, the impact of wastewater is limited and mitigated. With good implementation of the above-mentioned measures, the proposed project will not have significant negative impact on the local environment. Therefore, the proposed project can be carried out as planned.

Table A10. Operating Margin Emission Factor of North China Power Grid

		Year 2004	Year 2005	Year 2006	Total
A	Emissions (tCO ₂ e /year)	554,323,400	652,197,698	726,789,038	1,933,310,136
B	Power Supply (MWh)	493,687,660	564,680,013	672,621,593	1,730,989,266
C	CO ₂ Emission Factor (tCO ₂ e /MWh)	C = A/B			1.1169

Calculation of Build Margin (BM):

Step 1. Calculation of weights of CO₂ emissions of solid, liquid and gas fuel in total emissions for power generation

$$\lambda_{Coal} = \frac{\sum_{i \in COAL, j} FC_{i,j,y} \times EF_{CO2,i,y}}{\sum_{i,j} FC_{i,j,y} \times EF_{CO2,i,y}}$$

$$\lambda_{Oil} = \frac{\sum_{i \in OIL, j} FC_{i,j,y} \times EF_{CO2,i,y}}{\sum_{i,j} FC_{i,j,y} \times EF_{CO2,i,y}}$$

$$\lambda_{Gas} = \frac{\sum_{i \in GAS, j} FC_{i,j,y} \times EF_{CO2,i,y}}{\sum_{i,j} FC_{i,j,y} \times EF_{CO2,i,y}}$$

Where:

$FC_{i,j,y}$: Amount of fossil fuel type i consumed in province j in year y (mass or volume unit);

$EF_{CO2,i,y}$: CO₂ emission factor of fossil fuel type i in year y (tCO₂ /GJ);

COAL, OIL and GAS respectively refers to the group of solid, liquid, and gas fuels.

Based on China Energy Statistical Yearbook 2007, the calculation of the weights of solid, liquid, and gas fuels in North China Power Grid are:

$$\lambda_{Coal} = 98.93\%, \lambda_{Oil} = 0.09\%, \lambda_{Gas} = 0.98\%$$

Step 2: Calculation of Emission Factor of Relevant Thermal Power

$$EF_{Thermal} = \lambda_{Coal} \times EF_{Coal,Adv} + \lambda_{Oil} \times EF_{Oil,Adv} + \lambda_{Gas} \times EF_{Gas,Adv} \quad (5)$$

Where: $EF_{Coal,Adv}$, $EF_{Oil,Adv}$ and $EF_{Gas, Adv}$ respectively refers to the emission factor representing best technology commercially available for fuel of coal, oil or gas fired power plants. For specific workings, see the following:

Table A11. Emission factor representing best technology commercially available for fuel of coal, oil or gas fired power plants

	Variable	Efficiency of Power Supply	Emission Coefficient of Fuel (tc/TJ)	Oxidation Rate	Emission Factor (tCO ₂ e/MWh)
		A	B	C	D=3.6/A/1000*B*C*44/12
Coal-fired Power Plant	$EF_{Coal,Adv}$	37.28%	25.8	1	0.9135
