## 1 PROJECT DETAILS

### 1.1 Summary Description of the Project

The purpose of this project (Longyuan Mulilo De Aar 2 North Wind Energy Facility) is to supply the wind-generated electricity to the grid of the Republic of South Africa (RSA).

The project envisages the installation of a new grid connected wind farm at a site where no wind farm was operated prior to the implementation of the activity.<sup>1</sup>

The installed capacity of the wind farm is 144MW.<sup>2</sup> The wind farm consists of 96 wind turbines and the associated infrastructure.<sup>3</sup>

The wind farm is located in the Pixley Ka Seme District close to the town of De Aar in the Northern Cape Province of the RSA, approximately 30 km northeast of the Longyuan Mulilo De Aar Maanhaarberg Wind Energy Facility. Longyuan Mulilo De Aar 2 North (RF) (Pty) Ltd is the wind farm developer. An EPC contract was signed on 06/02/2015<sup>4</sup> and the wind farm started commercial operation on 31/10/2017, the produced electricity is supplied to the national grid of the RSA<sup>5</sup>.

The energy system of the RSA is dominated by coal-fired power plants and is managed by the state-owned company Eskom which is in charge of generation, transmission and distribution of power to end-users. The energy system of the RSA is integrated into the grid of Southern African Power Pool (SAPP), where South Africa is represented by Eskom.<sup>6</sup>

The greenhouse gas (GHG) emissions from the electricity generation at the wind farm will amount to zero. The reduction of GHG emissions as a result of the project implementation will be achieved due to reduction of CO<sub>2</sub> emissions from combustion of fossil fuel at the existing grid-connected powered plants and plants which would likely be built in the absence of the project.

The total GHG emission reductions at the end of the crediting period are expected to be 743,201 t CO<sub>2</sub>e, annual average GHG emission reductions are 356,737 t CO<sub>2</sub>e/year.

### 1.2 Sectoral Scope and Project Type

This project falls under sectorial scope: Energy (renewable/non-renewable).

<sup>5</sup> Eskom, Notice of Commencement of the Facility (De Aar 2 North – 138.96 MW), 30/10/2017

<sup>6</sup> <http://www.sapp.co.zw>

Project type is Renewable energy. Displacement of electricity that would be provided to the grid by more-GHG-intensive means.

### 1.3 Project Proponent

Organization name	Blue World Carbon Asset Management (Pty) Ltd (Primary project Proponent)
Contact person	Ilya Goryashin
Title	General Manager
Address	<a href="http://www.blueworldcarbon.com">http://www.blueworldcarbon.com</a>
Telephone	+27790908139
Email	<a href="mailto:Ilya.goryashin@blueworldcarbon.com">Ilya.goryashin@blueworldcarbon.com</a>

Organization name	Longyuan Mulilo De Aar 2 North (RF) (Pty) Ltd
Contact person	Bertus van Niekerk
Title	Project Manager
Address	1 <sup>st</sup> Floor, Mazars house, Rialto road, Grand Moorings Precinct, Century City, 7441
Telephone	+27715705168
Email	<a href="mailto:bertus@mulilo.com">bertus@mulilo.com</a>

### 1.4 Other Entities Involved in the Project

Longyuan Mulilo De Aar 2 North (RF) (Pty) Ltd (Longyuan Mulilo) is the wind farm developer. Blue World Carbon Asset Management (Pty) Ltd (BWC) is a carbon consultant employed to develop all necessary VCS documentation, facilitate VCS registration, monitor the present project (monitoring plan), facilitate verification and request of VCU's issuance from VERRA. BWC receives a fee for its services.

Organization name	Longyuan Mulilo De Aar 2 North (RF) (Pty) Ltd (Longyuan Mulilo)
Role in the project	The project owner and the wind farm developer
Contact person	Bertus van Niekerk
Title	Project Manager
Address	1 <sup>st</sup> Floor, Mazars house, Rialto road, Grand Moorings Precinct, Century City, 7441
Telephone	+27715705168

### 1.5 Project Start Date

31/10/2017, the day when the wind farm started commercial operation<sup>7</sup>

### 1.6 Project Crediting Period

31 October 2017 (00:00) – 30 November 2019 (24:00); 2.08333-year total period

### 1.7 Project Scale and Estimated GHG Emission Reductions or Removals

Project Scale	
Project	
Large project	x

Year	Estimated GHG emission reductions or removals (tCO <sub>2</sub> e)
31/10/2017 – 30/10/2018	356,737
31/10/2018 – 30/10/2019	356,737
31/10/2019 – 30/11/2019	29,727
<b>Total estimated ERs</b>	743,201
<b>Total number of crediting years</b>	2.08333
<b>Average annual ERs</b>	356,737

<sup>7</sup> Eskom, Notice of Commencement of the Facility (De Aar 2 North – 138.96 MW), 30/10/2017

## 1.8 Description of the Project Activity

The project comprises only one activity. A single wind farm was constructed close to the town of De Aar in the Northern Cape Province of the RSA, approximately 30 km northeast of the Longyuan Mulilo De Aar Maanhaarberg Wind Energy Facility, and has the total installed capacity of 144 MW<sup>8</sup>. The EPC contract was signed on 06/02/2015<sup>9</sup>, and the wind farm started commercial operation on 31/10/2017<sup>10</sup>. The supplier of the wind turbines is United Power. 96 x UP86 turbines were employed by the present project<sup>11</sup>. The operation data for UP86 are given in the following table<sup>12</sup>:

Parameter	Unit	Value
Rated power	MW	1.5
Cut-in wind speed	m/s	3
Cut-out wind speed	m/s	25
Design lifetime	years	20

The Longyuan Mulilo De Aar 2 North Wind Energy Facility has an installed capacity of 144 MW and annually supplies to the grid about 361 400 MWh<sup>13</sup> of electricity. The generated renewable electricity is transmitted through the national grid of the RSA.

Electricity delivered to the grid by the wind farm would have otherwise been generated by the operation of the grid-connected power plants of the SAPP and by the addition of new generation sources that is reflected in the combined margin CO<sub>2</sub> emission factor of 0.9871 t CO<sub>2</sub>/MWh adopted for the electricity system of the SAPP.

## 1.9 Project Location

The project is located on Farm 136 (Portion 1 and Portions 6), 148 (Portions 2, 4 and Remainder), 165 (Portion 1 and Portion 7), 149 (Portion 1), 150 (Portion 4 and Remainder), 151 (Portion 1 and Portion 2) outside of the town of De Aar. De Aar is the main town of the Emthanjeni Local Municipality located in the Northern Cape Province of the RSA (Figure 1.9-1 and Figure 1.9-2).

Geographical latitude: -30.538320. Geographical longitude: 24.262329. Time zone: UTC+2.

## 1.10 Conditions Prior to Project Initiation

Please refer to Section 2.4 (Baseline Scenario)

## 1.11 Compliance with Laws, Statutes and Other Regulatory Frameworks

The project is compliant with all relevant laws:

- National Environmental Management Act (No. 107 of 1998)<sup>15</sup>;
- The Electricity Regulation Act (No. 4 of 2006)<sup>16</sup> and associated Regulations: New generation capacity (No. R. 721, 2009)<sup>17</sup>.

The Environmental Impact Assessment (EIA) of the proposed project was carried out in accordance with the South African legislation by Aurecon South Africa (Pty) Ltd. EIA report was submitted to the Department of Environmental Affairs for a decision and finally approved on the 01/03/2013. Later, on 10/06/2013 the Amendment to Environmental authorization was issued by the Department of Environmental Affairs.

The electricity generation license was granted to the project.

## 1.12 Ownership and Other Programs

### 1.12.1 Project Ownership

Longyuan Mulilo De Aar 2 North (RF) (Pty) Ltd is the wind farm developer and the project owner.

### 1.12.2 Emissions Trading Programs and Other Binding Limits

The project has never been included in an emissions trading program or any other mechanism that includes GHG allowance trading.

### 1.12.3 Other Forms of Environmental Credit

The project has never received any forms of GHG-related environmental credits, including renewable energy certificates.

The project is eligible under the CDM and will seek CDM registration after the end of GHG Accounting Period with VCS programme.

### 1.12.4 Participation under Other GHG Programs

The project was not seeking registration under Other GHG Programs.

<sup>16</sup> <https://www.gov.za/documents/electricity-regulation-act>

<sup>17</sup> <https://www.gov.za/documents/electricity-regulation-act-regulations-new-generation-capacity>

### 1.12.5 Projects Rejected by Other GHG Programs

The project has never been rejected by any other GHG programs.

### 1.13 Additional Information Relevant to the Project

#### Eligibility Criteria

Not applicable

#### Leakage Management

Not applicable

#### Commercially Sensitive Information

Not applicable

#### Sustainable Development

This project satisfies all sustainable development goals of Host Party (DNA). The main benefits of the implementation of the present project are:

1. Social and economic: Promotion and development of wind power technology in the RSA which in turn will lead to the creation of new job opportunities both during the construction and operation phases and to growth in tax revenues. The project implementation led to creation of 30,342 person-month during the construction phase and 58,691 person-month during the operation phase. Sales of carbon credits generated by the project will result in increased foreign direct investment;
2. Environmental: Mitigation of the negative environmental impact. Combustion of fossil fuels (mostly coal) at Eskom's power plants and hereby emissions of the harmful substances into the atmosphere, such as flue gas, coal ash, oxides of sulphur and nitrogen will be reduced due to the implementation of the project; and
3. Other: Contribution to achievement of the national Government goal to generate 10,000 GWh of electricity from renewable energy by 2013<sup>18</sup> and the objective to reduce RSA's GHG emissions by approximately 34.00% below the current emissions baseline by 2020<sup>19</sup>.

#### Further Information

Not applicable

## 2 APPLICATION OF METHODOLOGY

### 2.1 Title and Reference of Methodology

ACM0002: “Large-scale Consolidated Methodology: Grid-connected electricity generation from renewable sources” (Version 19.0)<sup>20</sup>

TOOL01: “Methodological tool: Tool for the demonstration and assessment of additionality” (Version 07.0.0)<sup>21</sup>

TOOL05: “Methodological tool: Baseline, project and/or leakage emissions from electricity consumption and monitoring of electricity generation” (Version 03.0)<sup>22</sup>

### 2.2 Applicability of Methodology

The ACM0002 methodology is applicable to grid-connected renewable energy power generation project activities that (paragraph 3):

- (a) Install a Greenfield power plant;
- (b) Involve a capacity addition to (an) existing plant(s);
- (c) Involve a retrofit of (an) existing operating plants/units;
- (d) Involve a rehabilitation of (an) existing plant(s)/unit(s); or
- (e) Involve a replacement of (an) existing plant(s)/unit(s).

The proposed project activity envisages the construction and operation of the wind farm to produce electricity at the site where no renewable power plant has been previously operated and therefore the project falls under item (a)<sup>23</sup>. This project is connected to the grid of the Republic of South Africa.<sup>24</sup>

The project meets all necessary applicability conditions of the ACM0002 to apply (see Table 2-1).

Table 2-1: ACM0002 applicability conditions check

<sup>20</sup> <https://cdm.unfccc.int/methodologies/DB/VJ19AX539D9MLOPXN2AY9UR1N4IYGD>  
(this version of the methodology will be applied throughout the whole document)

<sup>21</sup> <https://cdm.unfccc.int/methodologies/PAMethodologies/tools/am-tool-01-v7.0.0.pdf>  
(this version of the methodology will be applied throughout the whole document)

<sup>22</sup> <https://cdm.unfccc.int/methodologies/PAMethodologies/tools/am-tool-05-v3.0.pdf>  
(this version of the methodology will be applied throughout the whole document)

<sup>23</sup> Final EIA report, April 2012

<sup>24</sup> Eskom, Notice of Commencement of the Facility (De Aar 2 North – 138.96 MW), 30/10/2017

Applicability condition	Applicability	Comment
4(a) The project activity may include renewable energy power plant/unit of one of the following types: hydro power plant/unit with or without reservoir, wind power plant/unit, geothermal power plant/unit, solar power plant/unit, wave power plant/unit or tidal power plant/unit.	Applicable	The project activity is the installation of the wind farm to produce electricity (greenfield plant).
4(b) In the case of capacity additions, retrofits, rehabilitations or replacements (except for wind, solar, wave or tidal power capacity addition projects) the existing plant/unit started commercial operation prior to the start of a minimum historical reference period of five years, used for the calculation of baseline emissions and defined in the baseline emission section, and no capacity expansion, retrofit, or rehabilitation of the plant/unit has been undertaken between the start of this minimum historical reference period and the implementation of the project activity	Not applicable	The project activity is the installation of a greenfield plant; therefore it does not need to satisfy this applicability condition.
5. In case of hydro power plants, one of the following conditions shall apply: etc.	Not applicable	The project activity is not the installation of a hydro power plant; therefore it does not need to satisfy this applicability condition.
6. In the case of integrated hydro power projects, project proponent shall: etc.	Not applicable	The project activity is not the installation of a hydro power plant, so it does not need to satisfy this applicability condition.
7. The methodology is not applicable to the:  Project activities that involve switching from fossil fuels to renewable energy sources at the site of the project activity, since in this case the baseline may be the continued use of fossil fuels at the site.  Biomass fired power plants.	Not applicable	This project does not involve switching from fossil fuels to renewable energy sources, it is also not a biomass fired power plant and therefore it satisfies this criterion.
8. In the case of retrofits, rehabilitations, replacements, or capacity additions, this methodology is only applicable if the most plausible baseline scenario, as a result of the identification of baseline scenario, is “the continuation of the current situation, that is to use the power generation equipment that was already in use prior to the implementation of the project activity and undertaking business as usual maintenance”	Not applicable	The project activity is the installation of a greenfield plant; therefore it does not need to satisfy this applicability condition.

ACM0002 refers to the following tools (paragraph 13):

- (a) “TOOL01: Tool for the demonstration and assessment of additionality”;
- (b) “TOOL02: Combined tool to identify the baseline scenario and demonstrate additionality”;
- (c) “TOOL03: Tool to calculate project or leakage CO2 emissions from fossil fuel combustion”;
- (d) “TOOL05: Baseline, project and/or leakage emissions from electricity consumption and monitoring of electricity generation”;
- (e) “TOOL07: Tool to calculate the emission factor for an electricity system”;
- (f) “TOOL10: Tool to determine the remaining lifetime of equipment”;
- (g) “TOOL11: Assessment of the validity of the original/current baseline and update of the baseline at the renewal of the crediting period”.

Tool (a) is applicable as per paragraph 8 of the tool itself and section 5.3.2 of ACM0002.

Tool (b) is not used as indicated in reference 2 to paragraph 9 of ACM0002.

Tool (c) is not used since project emissions for the project is zero as described in Section 3.2.2 below.

Tool (d) is applicable as per paragraph 68 of ACM0002 and paragraph 6(a) of the tool.

Tool (e) is not used since ASB0040-2018: Standardized baseline “Grid emission factor for Southern African Power Pool” (Version 01.0) is used to determine the value of the emission factor for an electricity system. The project meets all necessary applicability conditions of ASB0040-2018 to apply (see Table 2-2).

Table 2-2: ASB0040-2018 applicability conditions check

Applicability condition	Applicability	Comment
<p>3 (a) The project activity is implemented in any one of following countries, which are the SAPP member countries, and is connected to the SAPP:</p> <p>(i) Republic of Botswana; (ii) Democratic Republic of Congo; (iii) Kingdom of Lesotho; (iv) Republic of Mozambique; (v) Republic of Namibia; (vi) Republic of South Africa; (vii) Kingdom of Swaziland; (viii) Republic of Zambia, and (ix) Republic of Zimbabwe</p>	Applicable	The project is implemented in the Republic of South Africa <sup>25</sup> and is connected to the grid (item (vi)) <sup>26</sup> .
<p>3 (b) The CDM approved methodology that is applied to the project activity requires the determination of CO<sub>2</sub> emission factor(s) through the application of the grid tool</p>	Applicable	ACM0002 refers to TOOL07 to calculate the grid emission factors (paragraph 22).
<p>3 (c) The project activity uses the ex-ante options for both the operating margin and build margin grid emissions factors, as described in the grid tool, and therefore no monitoring or recalculation of the emission factor during the crediting period is required.</p>	Applicable	The project uses the ex-ante options for both the operating margin and build margin grid emissions factors.
<p>4. The latest approved and valid values of this standardized baseline are the only values of the CO<sub>2</sub> emission factor(s) that shall be applied for the project electricity system in the SAPP member countries listed under sub-para 3(a) above</p>	Applicable	The Standardized Baseline is valid till 06/10/2021. <sup>27</sup>

Tool (f) is not used since the project is a greenfield plant.

Tool (g) is not used since this is the first crediting period.

### 2.3 Project Boundary

The spatial extent of the project boundary includes the proposed renewable energy power plant and all power plants physically connected to the grid of the SAPP (Figure 2-1).

The greenhouse gases and emission sources included in or excluded from the project boundary are shown in table below.

<sup>25</sup> Environmental Authorization from the Department of Environmental Affairs, 01/03/2013 and Amendment to Environmental Authorization by the Department of Environmental Affairs, 10/06/2013

Figure 2-1: Project boundary

Source		Gas	Included?	Justification/Explanation
Baseline	CO <sub>2</sub> emissions from electricity generation in fossil fuel fired power plants that are displaced due to the project activity	CO <sub>2</sub>	Yes	Main emission source
		CH <sub>4</sub>	No	Minor emission source
		N <sub>2</sub> O	No	Minor emission source
		Other	No	Not applicable
	Not applicable	CO <sub>2</sub>	No	Not applicable
		CH <sub>4</sub>	No	Not applicable
		N <sub>2</sub> O	No	Not applicable
		Other	No	Not applicable
Project	GHG emissions from electricity generation in the proposed wind farm	CO <sub>2</sub>	No	GHG emissions for a wind power generation project are equal to zero (no fossil fuel auxiliary consumption)
		CH <sub>4</sub>	No	GHG emissions for a wind power generation project are equal to zero
		N <sub>2</sub> O	No	GHG emissions for a wind power generation project are equal to zero
		Other	No	GHG emissions for a wind power generation project are equal to zero
	Not applicable	CO <sub>2</sub>	No	Not applicable
		CH <sub>4</sub>	No	Not applicable
		N <sub>2</sub> O	No	Not applicable
		Other	No	Not applicable

## 2.4 Baseline Scenario

According to paragraph 22 of ACM0002, if the project activity is the installation of a Greenfield power plant, the baseline scenario is electricity delivered to the grid by the project activity would

have otherwise been generated by the operation of grid-connected power plants and by the addition of new generation sources, as reflected in the combined margin (CM) calculations.

The project is the installation of a new grid-connected wind farm that connects with and delivers electricity to the grid of the SAPP. The baseline scenario of the proposed project is:

Electricity delivered to the grid by the wind farm would have otherwise been generated by the operation of the grid-connected power plants of the SAPP and by the addition of new generation sources that is reflected in the combined margin CO<sub>2</sub> emission factor of 0.9871 t CO<sub>2</sub>/MWh adopted for the electricity system of the SAPP.

## 2.5 Additionality

The additionality of the project is demonstrated and assessed using TOOL01. This tool provides for the following step-wise approach:

- (a) Step 0 Demonstration whether the proposed project activity is the first-of-its-kind;
- (b) Step 1 Identification of alternatives to the project activity;
- (c) Step 2 Investment analysis;
- (d) Step 3 Barriers analysis; and
- (e) Step 4 Common practice analysis.

The project proponents start with Step 1.

Step 1: Identification of alternatives to the project activity.

There are two alternatives available to the wind farm developer, viz:

- (a) The proposed project undertaken without being registered as a CDM/VSC project activity;
- (b) Continuation of the current situation (no project activity undertaken).

Both the alternatives are credible, realistic and are in conformity with the applicable mandatory legal and regulatory requirements as the implementation of project activity is a voluntary initiative, is not mandated by any legal requirement and there is no legal requirement on the choice of a particular technology or restriction on the use of wind energy. Moreover, the approved methodology ACM0002 also prescribes the baseline and where the approved methodology prescribes baseline, discussion on alternatives is not necessary.

Step 2 Investment analysis

The project proponents demonstrate that the proposed project is not economically or financially feasible, without the revenue from the sale of certified emission reductions taking into account the

latest version of the “Guidelines on the assessment of investment analysis” (Version 05)<sup>28</sup>, available on the UNFCCC website (as per paragraph 30 of TOOL01).

Sub-step 2a: Determine appropriate analysis method

Since the baseline does not require any investment and is outside the direct control of the project developer, additionality is demonstrated using benchmark analysis, which is in conformity with guidance 19 of Annex 5, EB 62.

Sub-step 2b: Option III. Apply benchmark analysis

Project IRR has been chosen as the financial indicator, as the project is financed by a mix of debt and equity. Project IRR is one of the financial indicators prescribed by Additionality Tool and Annex 5, EB 62 for additionality demonstration. Hence, the financial indicator selected is in conformity with guidance 12 of Annex 5, EB 62 and sub-step 2b of TOOL01. Commercial lending rate has been selected as benchmark for the project activity, which is in conformity with guidance 12 of Annex 5, EB 62.

The commercial lending rate at the time of decision making was 12.98%. Commercial lending rate has been sourced from term lending rate published in June 2013 issue of Quarterly Bulletin published by the South African Reserve Bank<sup>29</sup>, which was the latest bulletin available at the time of decision making – August 2013.<sup>30</sup>

The benchmark therefore conforms to paragraph 12 of Annex 5, EB 62.

Sub-step 2c: Calculation and comparison of financial indicators

An investment decision to implement the project was taken by the project partners in August 2013, as clearly stated in the Extractions of the Resolution of the Board on 08/08/2013.

Various input parameters and assumptions used in the financial indicator calculation are given in the following table:

Table 3.5.1-1: Input data to calculate IRR

Parameter	Unit	Value	Acceptable data source/comment
Capacity of the wind farm	MW	144	- Garrad Hassan, Technical Due Diligence of the De Aar 2 North Wind Farm in South Africa, 26/07/2013

Parameter	Unit	Value	Acceptable data source/comment
ZAR exchange rate	ZAR/EUR	13.2	Reserve Bank official website <sup>35</sup>

Based on the above parameters and assumptions, the project IRR works out to 8.94%, as against the benchmark of 12.98%.

Since the project IRR is less than the benchmark, the project activity is additional.

Latest NERSA average tariff has been used in the financial indicator calculation.

In 08/2011, the Department of energy abandoned the Refit scheme in favour of a tender mechanism. Refit scheme was introduced in 03/2009 and guaranteed purchase prices (ZAR 1250/MWh) and long term contracts of 20 years. However, the tariffs that had been established in 2009 were due to be significantly reduced at a review on 26/05/2011 before the programme was dissolved completely. Under tender mechanism bidders have to propose tariff which will fall under technology dependent cap (ZAR 1,150/MWh has been fixed for onshore wind power projects under this cap). The proposed prices should make a single adjustment on April 1 each year in line with expected decreasing costs. In selecting the bidders 70.00% weight is given to financial aspects of the project and 30.00% to economic development which includes job creation, local content, ownership, management control, preferential procurement, enterprise development and socio economic development. Hence, the tariff the project likely to get was not known at the time of decision making. As per the unofficial information available from the second bids submitted, the tariff which the project would likely get was estimated at ZAR 900/MWh. However, it was observed that the project remains additional even if the highest applicable tariff of ZAR 1,150/MWh<sup>36</sup> is taken into consideration, as the IRR works out to 11.76% as against the benchmark of 12.98%.

The proposed project is not economically feasible. Therefore, the project is additional.

Sub-step 2d: Sensitivity analysis

The following variables have been selected for the sensitivity analysis:

- Investment cost
- Generation and Electricity tariff
- Operations and Maintenance (O&M) costs
- Administrative costs.

<sup>35</sup> <https://www.resbank.co.za/Research/Rates/Pages/SelectedHistoricalExchangeAndInterestRates.aspx>

<sup>36</sup> IRR of 10.00%, corresponding to the tariff of ZAR 1,150/MWh, can be calculated by putting "1" in the cell 'C106' in the financial worksheet. Reader are requested not to change the tariff in cell 'D13' because it will lead to escalation in tariff of 5.90% which is correct, as the maximum tariff is fixed and no escalation is allowed.

All the selected parameters except the last two constitute 20.00% of project cost/revenue. Though O&M cost and administrative costs constitute less than 20.00%, it was considered appropriate to subject them to sensitivity analysis as they account for substantial costs. The parameters have been subjected to 10.00% variation on either side. As stated earlier, the tariff which the project operator will get is not known. However, even at a tariff of ZAR 1,150/MWh (which represents the cap), the project remains additional. Generation is based on the figures provided to the lenders. The escalation in project load factor by 10.00% is unlikely. That apart, the project will lose its additionality only when the generation goes up to 35%, which no project has assumed. Investment cost is based on detailed studies, offer letter and the offer letters. With the country experiencing inflation of about 5.90%, any reduction in investment cost is ruled out. As regards O&M cost and administrative cost, they are expected to only go up as these expenses are subject to inflation and any reduction is hypothetical. Therefore, 10.00% variation is considered appropriate in the project context.

The results of the sensitivity analysis are displayed in Table 3.5.1-2.

Table 3.5.1-2: Sensitivity analysis of the project IRR

Variable	Variation		
	-10.00%	0.00%	+10.00%
Investment Cost	10.08%	8.94%	7.97%
Load factor or electricity tariff	7.64%	8.94%	10.18%
O&M Cost	9.05%	8.94%	8.83%
Administrative costs	8.96%	8.94%	8.92%

As evident, the financial indicator does not breach the benchmark even under most optimistic assumptions. Therefore, the project conforms to Sub-step 2d of Additionality Tool

The investment analysis provides a valid argument in favour of additionality.

#### Step 4: Common practice analysis

The common practise analysis was done as per Guidelines on Common Practice (Version 02.0):

Step 1: calculate applicable capacity or output range as +/-50% of the total design capacity or output of the proposed project activity.

The capacity of the project is 144 MW, thus the applicable capacity range is 72 – 216 MW.

Step 2: identify similar projects (both CDM and non-CDM).

Wind farms within the capacity range that located in South Africa and started commercial operation before 06/02/2015 summarised in Table 3.5.1-3.

Table 3.5.1-3: Similar projects (both CDM and non-CDM)

Project	Capacity	COD	CDM/non-CDM
Noblesfontein Wind Farm	75	2014	CDM
Dorper Wind Farm	100	2014	CDM
Red Cap Kouga Wind Farm	80	2014	CDM
Jeffreys Bay Wind Farm	138	2014	CDM
Cookhouse Wind Farm	140	2014	CDM

Step 3: within the projects identified in Step 2, identify those that are neither registered CDM project activities, project activities submitted for registration, nor project activities undergoing validation. Note their number  $N_{all}$ .

$$N_{all} = 0$$

Step 4: within similar projects identified in Step 3, identify those that apply technologies that are different to the technology applied in the proposed project activity. Note their number  $N_{diff}$ .

$$\text{Since } N_{all} = 0, N_{diff} = N_{all} = 0.$$

Step 5: calculate factor  $F = 1 - N_{diff}/N_{all}$  representing the share of similar projects (penetration rate of the measure/technology) using a measure/technology similar to the measure/technology used in the proposed project activity that deliver the same output or capacity as the proposed project activity.

$$F = 1 - N_{diff}/N_{all} = 1 - 0/0 = 1; N_{all} - N_{diff} = 0 - 0 = 0$$

The project is not a common practice within a sector in the applicable geographical area, since  $F < 0.2$  and  $N_{all} - N_{diff} < 3$ , the project is first in the applicable geographical area.

Therefore, no similar activities were identified.

The project is additional.

## 2.6 Methodology Deviations

Not applicable

## 3 QUANTIFICATION OF GHG EMISSION REDUCTIONS AND REMOVALS

### 3.1 Baseline Emissions

Baseline emissions include only CO<sub>2</sub> emissions from electricity generation in fossil fuel fired power plants that are displaced due to the project activity. ACM0002 assumes that electricity

delivered to the grid by the wind farm would have otherwise been generated by the operation of grid-connected power plants and by the addition of new generation sources. The baseline emissions are calculated as follows:

$$BE_y = EG_{PJ,y} \cdot EF_{grid,CM,y}$$

Where:

$BE_y$	=	Baseline emissions in year $y$ (tCO <sub>2</sub> )
$EG_{PJ,y}$	=	Quantity of net electricity generation that is produced and fed into the grid as a result of the implementation of the project in year $y$ (MWh)
$EF_{grid,CM,y}$	=	Combined margin CO <sub>2</sub> emission factor for grid connected power generation in year $y$ (tCO <sub>2</sub> /MWh)

Standardized baseline ASB0040-2018 is selected for the project (the applicability of ASB0040-2018 is justified Section 2 above). Table 1 of this standardized baseline provides the value of the combined margin CO<sub>2</sub> emission factor for the project electricity system applicable to wind and solar power generation for the determination of baseline emissions of 0.9871 t CO<sub>2</sub>/MWh.

### 3.2 Project Emissions

Since the project activity uses wind energy to generate electricity the project emissions are equal to zero:

$$PE_y = 0$$

Where:

$PE_y$	=	Project emissions in year $y$ (tCO <sub>2</sub> )
--------	---	---

### 3.3 Leakage

No leakage emissions are considered. The main emissions potentially giving rise to leakage in the context of electric sector projects are emissions arising due to activities such as power plant construction and upstream emissions from fossil fuel use (e.g. extraction, processing and transport). These emissions sources are neglected.

### 3.4 Net GHG Emission Reductions and Removals

Emission reductions are calculated as follows:

$$ER_y = BE_y - PE_y$$

Where:

$ER_y$	=	Emission reductions in year $y$ (tCO <sub>2</sub> )
$BE_y$	=	Baseline emissions in year $y$ (tCO <sub>2</sub> )
$PE_y$	=	Project emissions in year $y$ (tCO <sub>2</sub> )

The ex-ante calculations are shown below.

$$PE_y = 0 \text{ and } LE_y = 0;$$

The estimated amount of electricity supplied by the wind farm to grid during the crediting period, baseline emissions and emission reductions are presented in Table 3-1.

Table 3-1: Emission reductions, Baseline emissions, Quantity of net electricity generation supplied by the wind farm to the grid

Year	$EG_{\text{facility},y}$ (MWh/a) <sup>37</sup>	$BE_y$ (tCO <sub>2</sub> /yr)	$ER_y$ (tCO <sub>2</sub> /yr)
31/10/2017 – 30/10/2018	361,400	356,737	356,737
31/10/2018 – 30/10/2019	361,400	356,737	356,737
31/10/2019 – 30/11/2019	30,116	29,727	29,727

Calculation example:

$$BE_{\text{year 1}} = EG_{\text{PJ,year 1}} \times EF_{\text{grid,CM,year1}} = 361,400 \text{ MWh} \times 0.9871 \text{ t CO}_2/\text{MWh} = 356,737 \text{ t CO}_2$$

Year	Estimated baseline emissions or removals (tCO <sub>2</sub> e)	Estimated project emissions or removals (tCO <sub>2</sub> e)	Estimated leakage emissions (tCO <sub>2</sub> e)	Estimated net GHG emission reductions or removals (tCO <sub>2</sub> e)
31/10/2017 – 30/10/2018	356,737	0	0	356,737
31/10/2018 – 30/10/2019	356,737	0	0	356,737
31/10/2019 – 30/11/2019	29,727	0	0	29,727
<b>Total</b>	<b>743,201</b>	<b>0</b>	<b>0</b>	<b>743,201</b>

## 4 MONITORING

### 4.1 Data and Parameters Available at Validation

Data / Parameter	$EF_{\text{grid,CM}}$
Data unit	tCO <sub>2</sub> /MWh
Description	Combined margin CO <sub>2</sub> emission factor for grid connected power

<sup>37</sup> Garrad Hassan, Technical Due Diligence of the De Aar 2 North Wind Farm in South Africa, 26/07/2013, Appendix 3 Financial Model (value provided to banks and equity financiers while applying the activity for financing)

	generation calculated ex ante
Source of data	ASB0040-2018, Table 1
Value applied	0.9871
Justification of choice of data or description of measurement methods and procedures applied	Standardized baseline ASB0040-2018 is selected for the project (the applicability of ASB0040-2018 is justified Section 3.1.2 above). Table 1 of this standardized baseline provides the value of the combined margin CO <sub>2</sub> emission factor for the project electricity system applicable to wind and solar power generation for the determination of baseline emissions of 0.9871 t CO <sub>2</sub> /MWh
Purpose of Data	Calculation of baseline emissions
Comments	This value was appointed as a constant for the whole crediting period

#### 4.2 Data and Parameters Monitored

Data / Parameter	$EG_{PJ,y}$
Data unit	MWh
Description	Quantity of net electricity generation that is produced and fed into the grid as a result of the implementation of the project in year <i>y</i>
Source of data	On-site measurement by electricity meters, yielding the net electricity supplied to the grid of the RSA. Readings are cross-checked with records for delivered electricity.
Description of measurement methods and procedures to be applied	Calculated as the difference between the measured quantities of the grid electricity export and the import from grid. The meters are installed at the point of supply which defines the commercial boundary between grid and the wind farm owner. The export electricity meters are equipped with the check meters. The exported and imported electricity is continuously measured and recorded. Data are digitally archived at least on a monthly basis.
Frequency of monitoring/recording	Continuous measurement
Value applied	Estimated values for the purpose of calculating emission reductions: 31/10/2017 – 30/10/2018: 361,400 MWh 31/10/2018 – 30/10/2019: 361,400 MWh 31/10/2019 – 30/11/2019: 30,116 MWh
Monitoring equipment	The meter class is 0.5S.

	Landis+Gyr E650 (or similar) electricity meters shall be used. Serial numbers of currently installed main meters are: 37108386 and 37108384. Meters are installed at the on-site substation.
QA/QC procedures to be applied	Electricity meters will be calibrated once per 5 years according to South African Bureau of Standards (SABS) <sup>38</sup> (relevant industry standards in the RSA). Readings are cross-checked with records for sold/purchased electricity
Purpose of data	Calculation of baseline emissions
Calculation method	-
Comments	-

### 4.3 Monitoring Plan

The monitoring plan of project is devised as per approved consolidated baseline and monitoring methodology ACM0002 and TOOL05.

The following monitoring procedures shall be applied:

1. Monitoring period

The monitoring period starts from the date of commissioning of the project.

2. Data monitored and sources

The generated electricity is continuously measured and recorded at least on monthly basis by the wind farm personnel. The quantity of net electricity generation that is produced and fed into the grid in year y shall be determined on the basis of electricity meters. The metering instruments shall be installed in accordance with the requirements of the Grid and the Distribution Metering Codes at the point of supply which defines the commercial boundary between the wind farm owner and the grid. Readings of the electricity meters shall be cross-checked with delivery records. Data on electricity supply will be digitally archived and submitted to BWC.

The sources of data for calculation of GHG emission reductions in the course of monitoring shall be the internal reports of the wind farms.

The emission reductions shall be calculated using the formulas in Section 3.2.

3. The monitoring team

<sup>38</sup> According to the SABS the SANS 474 regulation should be followed as per Table 5 on page 22 section 4.7.4.1.

The wind farm staff shall undergo the necessary training related to operation and maintenance of the wind farm. The maintenance personnel of the wind farm are responsible for daily control over the monitoring plan implementation.

The Plant Manager of the wind farm is responsible for timely calibration of all instrumentation in accordance with the manufacturer's requirements and requirements of the South African Bureau of Standards<sup>39</sup>. Longyuan Mulilo's personal will be responsible for implementation and overall control as well as collection of all data, and submit the data to BWC.

Specialists of BWC will calculate GHG emission reductions with data that will be provided by Longyuan Mulilo.

In case of any doubts as to the accuracy of the data, the specialists of Longyuan Mulilo shall check and correct the data. The preliminary version of the monitoring report shall be submitted to the specialists of Longyuan Mulilo for review. In case any mistakes are found in the calculations of GHG emission reductions, the specialists of BWC shall correct these calculations accordingly.

#### 4. Data storage

All data collected as part of monitoring plan should be archived electronically and be kept at least for 2 years after the end of the crediting period.

#### 5. Instrumentation calibration

The instrumentation calibration and check-out shall be carried out by contracted specialized organisations that are licensed for this type of activity, according to the requirements of the manufacturing company, and the South African Bureau of Standards (SABS).

#### 6. Emergency situations

If any instrument that is used in the monitoring process fails, Longyuan Mulilo shall remedy the situation as soon as possible and if necessary shall replace the instrument. Electricity meters are equipped with the check meters. In case of failure of main meter, the reading of check meter will be used. In case both meters (main and check) fail net electricity generation will not be accounted for which is conservative. In case of breakdown of any of the wind turbines the electricity generation will go down, and amount of electricity supplied to the grid by the wind farm will be reduced. All accidents that may occur at the wind farm shall be recorded by Longyuan Mulilo. Information on major accidents shall be included in the monitoring report.

## 5 SAFEGUARDS

### 5.1 No Net Harm

The proposed project activity has no significant impact on the environment, as the wind power is one of the cleanest sources of renewable energy, with no associated emissions and waste

---

<sup>39</sup> According to the SABS the SANS 474 regulation should be followed.

products. Socio-economic impact is positive. Possible negative impacts are discussed in the ensuing paragraphs below:

1) Impact on biodiversity and ecosystems

Reptiles may be forced out of their underground shelters during the construction phase. Birds and bats may be impacted through collision with the blades of the wind turbines as well as collision with the associated power line during the operational phase.

2) Noise impact

The noise from construction machines has some impact on the surrounding area during the construction phase, which will only have a localized effect and is not expected to increase the ambient noise levels in nearest towns.

During the operation phase the cumulative contribution of the wind turbines and the transformer substation on the noise environment at the communities around the site will be within acceptable levels.

3) Impact on natural resources

The impact on the natural resources is the loss of arable land due to the construction of the turbines and associated infrastructure. However, most of the current cultivation or grazing practices will still be possible between the structures.

4) Impact on the atmosphere

The main impact is related to formation of dust during the construction period from land excavation and transportation vehicles. It should be mentioned that combustion of fossil fuels (mostly coal) at the Eskom power stations and hereby emissions of the harmful substances into the atmosphere, such as flue ash, oxides of sulphur and nitrogen will be reduced due to the project implementation.

## 5.2 Environmental Impact

The Environmental Impact Assessment (EIA) of the proposed project was carried out in accordance with the South African legislation by Aurecon South Africa (Pty) Ltd. EIA report was submitted to the Department of Environmental Affairs for a decision and finally approved on the 01/03/2013. Later, on 10/06/2013 the Amendment to Environmental authorisation was issued by the Department of Environmental Affairs.

## 5.3 Local Stakeholder Consultation

The project owner appointed Aurecon South Africa (Pty) Ltd to undertake the Scoping and Environmental Impact Assessment and associated Public Participation Process (PPP) in terms of the NEMA EIA Regulations and VCS requirement.

Public Advertisements were placed in Local newspapers, the Echo and Die Volksblad, notifying the broader public of the initiation of the EIA and inviting them to register as Interested and Affected Parties (I&APs) from 4 November 2011.

Holding a public meeting on Wednesday, 30 November 2011 to present and discuss the findings of the DSR at the De Aar Civic Hall from 16:00-18:00. Notes of the public meeting were sent to all those who attended on 8 November 2011.

I&APs had 40 days, until the 5 January 2012 to submit their written comments on the DSR, however due to a mailing error the period was extended to 9 January 2012. Cognisance was taken of all comments when compiling the final report, and the comments, together with the project team and proponent's responses thereto, were included in final report.

The Final Scoping Report (FSR) was made available to the public for review and comments until 7 February 2012 at the same locations as the DSC from 18 January 2012. All registered I&APs were informed of the lodging of the FSR by means of a letter posted on 17 January 2012. The FSR outlined the full range of potential environmental impacts and feasible project alternatives and how these were derived. Moreover, it included a Plan of Study for EIA, which outlined the proposed approach to the EIA phase, including the requisite specialist investigations to be undertaken.

The further details are given in the final EIA report.

#### **5.4 Public Comments**

No negative comments were received
