1 SUMMARY OF SDG CONTRIBUTIONS

Table 1: Summary of Project SDG Contributions

Row number	Estimated Project Contribution by the End of Project Lifetime	SDG Target	SDG Indicator	Net Impact on SDG Indicator	Section Reference	Claim, Asset or Label
1)	3,287.1575*10 ⁴ m ³ of biogas will be captured annually for heat generation.	7.2	7.2.1 renewable energy share in the total final energy consumption	Implemented activities to increase	3.2 #3,4	Claim
2)	14 permanent jobs (including 7 females and 7 males) for the local residents will be created during operation period of the project.	8.5	8.5.2 Unemployment rate, by sex, age and persons with disabilities	Implemented activities to increase	3.2 #1,2,3	Claim
3)	77,693tons of organic fertilizers will be produced annually.	12.5	12.5.1 National recycling rate, tons of material recycled	Implemented activities to increase	4.2 #2	Claim
4)	The project installs 7 sets of animal waste management system (AWMSs) to avoid methane emissions generated in the previous manure treatment process of uncovered anaerobic lagoons, which is the baseline scenario of the project. It is estimated that the annually emission reductions of the project will be 321,663 tCO ₂ e.	13.0	Tones of greenhouse gas emissions avoided	Increase	4.2 #1, VCS PD and validation report	SD VISta-labeled VCU

2 PROJECT DESIGN

2.1 Project Objectives, Context and Long-term Viability

2.1.1 Summary of Project Sustainable Development Objective(s)

Before the project, the animal waste generated by the swine farms were usually treated in the uncovered anaerobic lagoons at the project site. It is a kind of harmless treatment process for manure and permitted by laws and regulations of China¹. However, the methane generated in the anaerobic lagoons is emitted to the atmosphere directly without any recovery or reuse facilities. Besides, it is not mandatory by the local policy to take resourceful treatment technology for the animal manure. Therefore, uncovered anaerobic lagoon is still the most economic, viable and reasonable measures to treat the animal manure.

The project activity installs 7 new sets of animal waste management systems (AWMSs) to replace the previous uncovered anaerobic lagoons for the manure treatment. All the manure and wastewater of the 7 existing swine farms are collected into the collection tanks and then be separated firstly by solid and liquid separators. The solid is treated in aerobic composting system and the organic fertilizers can be produced, part of the fertilizer is distributed to local farmers for free and the others would be sold on the domestic market. The liquid is treated through anaerobic digestion and the biogas generated during the treatment process is captured for heat generation. If there is surplus biogas, then the biogas would be flared through the flaring system. After anaerobic digestion, the sludge produced from anaerobic digestion is treated through aerobic composting together with the separated solid, the effluent is used for agricultural irrigation. Sustainable development objectives of the project can be summarized as follows,

SDG 7 Affordable and Clean Energy

The biogas generated during the treatment process is captured for heat generation, the heat generated are all used by the operation of AWMSs and the 7 swine farms, which was provided by the coal-fired boiler without the project. Prior to the implementation of the project, all manure waste produced from the existing 7 swine farms was left to decay in 7 uncovered anaerobic lagoons at the livestock farms and methane is emitted to the atmosphere directly without any methane recovery and destruction facility. The project activity reduces of GHG and provides clean energy. $3,287.1575 \times 10^4 \text{m}^3$ of biogas are expected to produce annually. Compared with coal, biogas is a kind of clean and renewable energy. The project provides useful reference for the resourceful treatment technology of animal manure.

¹ <https://oss.baigongbao.com/2020/12/14/MRyhTKQcWC.pdf>

SDG 8 Decent Work and Economic Growth

It plans to create 14 permanent jobs for the local residents during operation period of the project. The job opportunities will be provided to the local residents fairly regardless of gender, age, education and other possible aspects of discrimination. The project will provide welfare and salary higher than the average level of local farmers. Equal salary will be paid for work of equal value.

SDG 12 Responsible Consumption and Production

The project activity is designed to install new AWMSs to treat the manure. After liquid-solid separation, the solid will be treated in aerobic composting system and the organic fertilizers will be produced, which partly will be supplied to the farmers living around free and partly will be sold as fertilizer. In the baseline uncovered anaerobic lagoons, no organic fertilizers can be generated. It *is estimated* that 77,693tons of organic fertilizers will be produced annually.

SDG 13 Climate Action

The project installs 7 sets of animal waste management system (AWMSs) to avoid methane emissions generated in the previous manure treatment process of uncovered anaerobic lagoons, which is the baseline scenario of the project. It is estimated that the annually emission reductions of the project will be 321,663 tCO₂e. Besides, it will help to raise the awareness of climate change and GHG emissions for the local villagers.

2.1.2 Description of the Project Activity

The project activity installs 7 sets of new AWMSs to replace the traditional uncovered anaerobic lagoons to treat the swine manure from the 7 existing swine farms. All the swine farms were put into operation before implementation of the project activity. The total design scale of the 7 swine farms is to accommodate 370,860 heads of market swine and 38,500 heads of breeding swine.

The AWMS installed at each swine uses the same technology, and the treatment capacities of each AWMS, the capacity of the boiler and the scale of the composting process will be adjusted based on the daily stock of animals and related manure generated. 1,637 tons of manure can be treated daily by the 7 sets of AWMSs. It is estimated that $3,287.1575 \times 10^4$ m³ of biogas will be produced annually through the anaerobic digestion process. The heat production is estimated to be 657,340GJ annually. Also, the generated heat is only used for daily operation of AWMSs and 7 swine farms themselves and cannot be connected to other users. The process flow chart of the project is shown as Figure1.

Figure 1 Process Flow Chart of the Project

Solid-liquid separation

All the manure and wastewater of the 7 existing swine farms will be collected and then be separated firstly by solid-liquid separator. the separated solid manure is sent to the aerobic composting system for organic fertilizers production, the liquid manure enters the anaerobic fermentation stage to continue processing.

Anaerobic digestion process

Fully Geo-membrane enclosed anaerobic tanks are adopted to treat the manure anaerobically. High-density polyethylene (HDPE) geomembranes are integrated into the base and top membranes through anchor trenches, with anaerobic fermentation and gas storage functions therefore, fully Geo-membrane enclosed anaerobic tanks integrate fermentation and gas storage, and impermeable and high-density polyethylene HDPE geomembrane to seal the whole anaerobic tanks is applied in order to capture GHG and keep anaerobic conditions within the digester. Its manure treatment principle is the same as other anaerobic fermentation processes, relying on the metabolic function of anaerobic bacteria to degrade the organic matter in the manure and produce biogas. In cold season, fully enclosed biogas digester would be heated through boilers. Therefore, it is possible to state that the external environment does not affect digester treatment, i.e., it operates independently from meteorological factors. The temperature of the anaerobic treatment unit of the project is designed as medium temperature i.e. 30 ~ 35 °C.

Comprehensive utilization of captured biogas

The biogas generated during the anaerobic digestion process is a kind of mixed gas, which includes CH₄, CO₂, H₂S, saturated steam and suspended granular impurities. Therefore, desulfurization and purification treatments are required. The purified biogas will enter the boilers for heat generation. The heat generated is used by the AWMS and the 7 swine farms. Surplus biogas would be flared (if any).

Aerobic composting process

The solid part of the manure separated and the sludge generated from anaerobic digestion process will be treated in aerobic composting system. The aerobic composting process of this project adopts trough composting technology. The trough composting system is generally equipped with a vent pipe or a gas distribution device installed on the trough. When turning over, the air blower is used to supply the oxygen required for fermentation. The composting cycle of the blast trough composting system is 2-4 weeks.

During the operation period of the 7 sets of AWMSs, 14 permanent jobs (2 employees needed for operation of AWMS in each swine farm) will be created by the project activity. Trainings will be provided for them to monitor the parameters required for calculating the emission reductions.

2.1.3 Implementation Schedule

Date	Milestone(s) in the Project's Development and Implementation
November -2018	Accomplished environmental impact assessment registration form
22-March-2019	Completion of project evaluation report
30-May-2019	Obtained official approval for the environmental impact assessment registration form
24-October-2019	Signed the general construction contract
10- November -2019	Start date of the first swine farm (Wolong 2 nd farm) to construct the AWMS
15-November-2019	Signed the purchase contract of boiler
08-Decemer-2019	Start date of the last swine farm (Zhengyang 13 th farm) to construct the AWMS
12-June-2020	Training for the employees before commissioning date of the AWMSs.
17-June-2020	Commissioning date of the AWMS for the first swine farm (Zhengyang 13 th farm)
25-June-2020	Commissioning date of the AWMS for the last swine farm (Wolong 2 nd farm)

15-July-2020	Formally put into operation of all the 7 sets of AWMs
23-July -2021	Training for the employees in 2021

2.1.4 Project Proponent

Organization Name	Muyuan Foods Co., Ltd.
Role in the Project	Project Owner
Contact Person	Lu Chang
Title	Project Manager
Address	Longsheng Industrial Park, Wolong District, Nanyang City, Henan Province, P.R China
Telephone	+86 199 6296 0254
Email	hnsinglo@sohu.com

2.1.5 Other Entities Involved in the Project

Organization Name	Profit Carbon Environmental Energy Technology (Shanghai) Co., Ltd.
Role in the Project	Consultation
Contact Person	Joanna Zhu
Title	Project Director
Address	Room 302, 2815 Longteng Avenue, Xuhui District, Shanghai City, P.R China
Telephone	+86 21 6127 2386
Email	yanan.zhu@profitcarbon.com

2.1.6 Project Type

The project follows the framework of energy industries (renewable -/ non-renewable sources, sectoral scope 01), waste handling and disposal (sectoral scope 13), and livestock and manure management (sectoral scope 15). The project is not a grouped project.

2.1.7 Project Location

The project is located in Henan Province, China. The location of the seven swine farms is shown in Table 2 and Figure 2.

Table 2 The location of swine farms involved in the project

Swine farm	Location	North latitude	East longitude
Wolong 2 nd farm	Shaozhuang Village, Luying township, Wolong District, Nanyang City	32° 52'9.05"	112°27'15.77"
Junzhang 26 th farm	Junzhang Village, Wangdian Township, Neixiang County, Nanyang City	33° 7'55.24"	111°54'37.62"
Zhengyang 1 st farm	Laodian Village, Pengqiao Township, Zhengyang County, Zhumadian City	32° 26'42.00"	114°23'13.20"
Zhengyang 4 th farm	Liwa Village, Lanqing Township, Zhengyang County, Zhumadian City	32° 28'25.36"	114°13'14.56"
Zhengyang 6 th farm	Liwa Village, Lanqing Township, Zhengyang County, Zhumadian City	32° 29'19.54"	114°18'12.82"
Zhengyang 9 th farm	Lanqing Village, Lanqing Township, Zhengyang County, Zhumadian City	32 °23'54.43"	114 °36'10.94"
Zhengyang 13 th farm	Xiemiao Village, Dougou Township, Zhengyang County, Zhumadian City	32° 26'37.43"	114°18'20.30"

Figure 2 The geographic location of swine farms involved in the project

2.1.8 Baseline Scenario

Before the project activity, the manure was treated in 7 separate uncovered anaerobic lagoons at each swine farm. It is a kind of harmless and most economic treatment process for manure. However, the biogas generated was emitted to the atmosphere directly without any recovery or reuse facilities. With the main component of methane (CH₄), the biogas is a kind of clean and renewable energy. Besides, methane is one of the main greenhouse gases. Far from resource utilization of the biogas generated, the traditional manure treatment process through uncovered anaerobic lagoons increases the effect on global climate change.

In China, the GHG emissions on agriculture, forestry and other land use account for 18.4% of the total carbon emissions. Methane emissions in animal husbandry with a 31.5% share for GHG emissions on agriculture, forestry and other land use². There is a cap & trade scheme in China. However, it only covers the high-emission industries, such as power generation sector that emitted at least 26,000 tons of CO₂e/year³. There is no emission cap enforced for the project owner⁴.

The project is located in relatively underdeveloped rural areas. The local residents live on farming or other heavy manual labour with poor working conditions. In 2021, the per capita disposable income of rural residents in Nanyang City, Henan Province was CNY 17,603⁵, which was 49.89% lower than that of national residents⁶. There is a shortage of job opportunities with good working conditions, vocational training and stable income in the rural area of Henan Province.

As per 14th Five-Year Rural Revitalization and Agricultural and Rural Modernization Plan of Henan Province⁷ issued by Henan Provincial People's Government on 31-December-2021, local government will continue to carry out activities such as reducing and increasing the efficiency of chemical fertilizer, organic fertilizer substitution. However, due to the higher production costs, lack of large-scale special machinery for organic fertilizer application and Slow fertilizer efficiency, etc., it is hard to promote the use of organic fertilizer⁸.

2.1.10 Threats to the Project

Type of Risk	Main Threats	Solution
Natural	Classical swine fever virus (CSF)	- All the project swine farms have established adequate biosecurity measures, which includes but not limit to regular disinfection, health monitoring, disease recognition and etc. - In order to restrict strictly the transfer of live pigs and their products across regions, only those that meet related epidemic prevention policy can be circulated in the market. - To avoid kitchen waste feeding. If food waste is contaminated by CSF, the healthy pigs can be infected.
	COVID-19	The COVID-19 pandemic might impact the feedback and monitoring process of project. All the epidemic prevention policy related to COVID-19 are followed by the project owner. For the employees of swine farms carrying out project monitoring, epidemic prevention and control measures are taken, which include strict disinfection, wearing masks

		and other protective gear, regular nucleic acid testing, controlling the social safety distance, and providing dormitories for employees on the farm, etc. to ensure that the infection and spread of new crowns are controlled at source. If it is necessary, the feedback process will be conducted online. Invitations and related information will be sent to the local stakeholders through email, telephone or We Chat.
Human-induced	Fire or explosion caused by leakage of biogas.	All the related employees are trained on safety operation of the AWMS. All employees must strictly implement the safety procedures during the operation period of AMWSs, which are set by the company. Portable gas detection alarm is equipped in each swine farm to detect gas concentrations in different locations, audible and visual alarm will be issued if it exceeds the normal range.
	Leakage of manure waste into ground water.	The project obtained the EIA approval from local governmental authorities. The project activity is compliance with environmental laws and regulations. Fully Geo-membrane enclosed anaerobic tanks applied in the project is sealed by HDPE geomembrane, which is impermeable and leak-proof, and laying HDPE impermeable membranes inside the excavated soil pit. Therefore, the anaerobic tanks are impermeable and will not cause leakage of manure waste into ground water. During construction period of the project, sedimentation tanks are built and the wastewater generated can be reused. Digested effluent generated during the operation period of the AWMS will be

		irrigated to the surrounding crops after treatment.
--	--	---

2.1.11 Benefit Permanence

The project installs new AWMs to 7 existing swine farms. The purpose of the project activity is to treat the manure and wastewater to avoid methane emissions generated in the baseline uncovered anaerobic lagoons. It can contribute to local sustainable development in the following aspects:

The project activity reduces of GHG in the atmosphere through avoiding methane emissions from anaerobic treatment of swine manure and wastewater.

Capture of methane will significantly reduce the odor nuisance in the vicinity of the facility.

As a kind of renewable energy, the biogas generated will be used for heat generation, which will help to lessen the reliance on fossil fuels.

Decent and fair job opportunities will be provided to local residents, which will help to reduce the local unemployment rate.

The generated good organic fertilizers are partly supplied to the farmers living around free, they can be used to yield organic products and improve the income of the farmers.

2.2 Stakeholder Engagement

2.2.1 Stakeholder Identification

The stakeholders have been identified as individuals who will be directly or indirectly impacted due to the project activity.

Direct stakeholders are those who deemed to either have a direct influence on the project or be directly influenced by the project, including but not limit to original staff of the swine farms and local residents.

The indirect stakeholders mainly include the consultant and other third-party agencies of the project.

2.2.2 Stakeholder Description

Stakeholder Category	Direct/Indirect Affected	Relevance to the Project Activity
Original staff of the swine farm	Direct	The original uncovered anaerobic lagoons are removed and new sets of AWMSs are installed at 7 existing swine farms.
Local residents around the project site	Direct	New job opportunities and free organic fertilizer may be provided for them.
Local government including development and reform commission, ecological environment bureau, and agriculture and rural affairs bureau	Direct	- To make relevant standard and guideline for manure management. - Approval for construction and operation of the AWMSs. - Daily supervision of normal operation of the swine farms.
Profit Carbon Environmental Energy Technology (Shanghai) Co., Ltd.	Indirect	Consultant of the carbon reduction project.

2.2.3 Stakeholder Consultation

Local stakeholder consultation was conducted by project owner before the construction of the project and during the monitoring period through the means of meeting and questionnaire.

In order to solicit the opinions and attitudes of various stakeholders on the construction of this project, the project owner issued a stakeholder survey opinion form at each project site from 06-

January-2020 to 10-January-2020 investigate the opinions of local residents on the construction of this project. A total of 105 questionnaires were issued for this project, 15 copies for each project site, and 105 copies were collected. The basic information about the survey respondents is listed in Table 3.

Table 3 Structure of stakeholder survey

Items		Amount
Gender	Male	57
	female	48
Age	<25	11
	25-55	80
	>55	14
Education	Junior high school or below	10
	Senior high school	78
	College or above	17
Occupation	Worker	21
	Farmer	54
	Management personnel	17
	Civil servant	13

The survey results are as follows:

1. 97% of the respondents understand this project, 3% don't know much about this project.
2. 100% of the respondents believe that the implementation of this project has reduced environmental pollution and is an environmental protection project.
3. 100% of the respondents believe that the implementation of the project will bring economic benefits to their lives, because they get free organic fertilizer.
4. 97% of the respondents believe that the implementation of the project is in harmony with the local ecosystem; 3% of the respondents are not sure whether it is in harmony.
5. 100% of the respondents believe that the implementation of the project has a good impact on the social economy.
6. 100% of the respondents believe that the construction of this project can promote energy conservation and emission reduction, improve environmental quality and investment environment, and promote the sustainable development of the local economy.
7. 94% of the respondents believe that the implementation of this project can promote employment growth; 6% of the respondents believe that it has no impact on local employment.
8. 100% of respondents believe that AWMS technology can be vigorously promoted.
9. 100% of respondents support this project.

The project owner carefully listened to and accepted the suggestions and opinions of stakeholders and stated that it would implement environmental protection facilities (AWMS) in strict accordance with the requirements in the environmental impact report form and the approval opinions of the local environmental protection bureau. Protect the environment and promote local sustainable development. There is no suggestion about the project design.

During operation period of the project, questionnaire survey was conducted for stakeholder consultation from 30-August-2020 to 03-September-2020. The project proponent put up public announcements at the villages near the project site, and contacted the local authorities (mainly the ecology and environment bureau, agriculture and rural affairs bureau) by phone. The general information about the introduction of project, the date and the purpose of the questionnaire survey as well as the project proponent's phone number and email address were clearly conveyed via these public announcements and phone calls. The basic information about the survey respondents is listed in Table 4. Responses and comments from these questionnaires are summarized in Table 5. All the stakeholders replied to the questionnaires are supportive of the project.

Table 4 Structure of Stakeholder Survey

Table 5 Summary of the Survey Results

No	Question	Response	Amount	Percentage
1	Do you know the purpose of this project?	Very much	65	93%
		A little	5	7%
		Not at all	0	0%
2	What do you think is the impact of the implementation of this	Reduce odor	42	60%
		Improve water quality	16	23%

	project on the local environment?	Reduce waste pollution	12	17%
		none	0	0%
3	What impact do you think the implementation of this project will have on your life?	Improve the quality of surrounding environment	23	33%
		providing employment opportunities	25	36%
		Free use of fertilizer	22	31%
4	Are you satisfied with the environmental protection measures that the proposed project has made?	Satisfied	70	100%
		Dissatisfied	0	0%
		Indifferent	0	0%
5	What do you think is the impact of the proposed project on local employment?	Positive	66	94%
		Negative	0	0%
		None	4	6%
6	What do you think is the impact of the proposed project on local economy?	Positive	66	94%
		Negative	0	0%
		None	4	6%
7	In general, what is your attitude towards the Project construction?	Supportive	70	100%
		Against	0	0%
		Indifferent	0	0%
8	Do you think other regions should also vigorously promote this type of technology?	Yes	60	86%
		No	0	0%
		No idea	10	14%

In all, all the stakeholders are all supportive of the project and to date there has been no need to modify the due to the comments received.

2.2.4 Continued Consultation and Adaptive Management

In order to set up the mechanism for on-going communication with local stakeholders, a grievance book was put at the entrance of each swine farm. All stakeholders are allowed to record their grievances or comments in the book at any time.

Due to the impact of COVID-19, consultation can be conducted online, such as email, telephone, We Chat or video conference.

2.2.5 Anti-Discrimination

The project does not involve and is not complicit in any form of discrimination based on gender, race, religion, sexual orientation or any other basis. The project respects all the rights to the women conferred to them by the *Constitution of the People's Republic of China, the Labour Law of the People's Republic of China, Special provisions on labour protection of female employees* and other related regulation and policies. The project will not directly or indirectly reinforce gender-based discrimination and shall not lead to/contribute to adverse impacts. Gender equality will be attained by ensuring that both men and women will have equal opportunities to jobs created and trainings. The project will further ensure equal pay for equal value of work.

2.2.6 Worker Training

Capacity building and training for the employees is necessary for normal operation of the AWMSs. Trainings will be accessible to all the employees, with emphasis on those recruited from local residents. All the staff working in the swine farms will be informed of risks and trained on measures to avoid it. Generally, the training will cover the following topics,

- Background of carbon emission reductions and climate change.
- Basic requirements of Verra for issuance of carbon credits.
- Safety operation process of the AWMSs, especially for avoidance of fire and leakage of biogas.
- Parameters monitored and methodology.

2.2.7 Equal Work Opportunities

The project provides equal job opportunities for local residents regardless of gender, race, religion, sexual orientation or any other basis. All the project policy on human resource, including but not limit to recruitment, salary and benefits, takes into account the labour laws of China to build an inclusive workplace and culture.

2.2.8 Workers' Rights

Contract will be signed with each employee to state specific rights, obligations and benefits of the job. Forced labour and child labour are forbidden by the project. Everyone is free to join or the leave the project swine farm. The project owner abides labour laws and local requirements of China to provide a safe and fair work environment for the employees.

2.2.9 Occupational Safety Assessment

The project activity does not adversely affect the health of the employees or other stakeholders. It is in compliance with local and national laws on Environmental, Health and Safety. Adequate training will be provided to the employees constantly, which covers the safety instructions. Besides, necessary safety instruments such as portable gas detection alarm are equipped in each swine farm to detect gas concentrations in different locations, audible and visual alarm will be issued if it exceeds the normal range. Fire and leakage of biogas will be prevented effectively.

2.2.10 Feedback and Grievance Redress Procedure

In order to document the project's feedback and grievance redress procedure, the project set up the mechanism for on-going communication with local stakeholders, a grievance book is put at the entrance of each swine farm. All stakeholders are allowed to record their grievances or comments in the book at any time.

Due to the effect of COVID-19, the input and grievance expression process could be reflected via telephone, email or We Chat. All the contact information is announced to the stakeholders during the local stakeholder consultation process. The project owner will take necessary action on the issue raised by the stakeholder within 48 hours.

2.2.11 Feedback and Grievance Redress Procedure Accessibility

The contact details of the grievance redressal information, including contact person, telephone, email, We Chat and address of each swine farm are announced to all stakeholders during the stakeholder consultation process. The grievance book is available at each swine farm.

2.2.12 Stakeholder Access to Project Documentation

Key project information was sent to the stakeholders before the stakeholder consultation process. The project documentation will be uploaded on website of Verra and the related link has also been informed to the stakeholders. On the request of stakeholders, the project document, monitoring reports and other relevant documents will be provided as requested in a timely manner. All the stakeholders can contact the project owner via telephone, email or We Chat.

2.2.13 Information to Stakeholders on Assessment Process

The detailed process for registration of carbon reduction project under Verra has been explained to the stakeholders during local stakeholder consultation. The stakeholders will be informed of the SD Vista assessment process via email, telephone or We Chat as requested. All the periodical

achievement of the assessment will be communicated with the stakeholders, such as the start date of 30 days public comment period, ways to submit comments on the project, as well as on-site results of validation and verification of the VVB.

2.3 Project Management

2.3.1 Avoidance of Corruption

China has strict laws to prevent corruption. The proponent of the project also established relevant code of conduct and business ethics to avoid corruption of the management and employees. These policies are in line with all legal requirements and are held to the highest standards of operation. As per public information listed in National Enterprise Credit Information Publicity System⁹, neither of the project proponent were involved in nor complicit in any form of corruption such as bribery, embezzlement, fraud, favouritism, cronyism, nepotism, extortion, and collusion.

2.3.2 Statutory and Customary Rights

The project activity is constructed and operated in the swine farms owned by the project owner. There are no uncertainties and changes to land tenure arrangements, resource access rights, community-based property rights and customary rights, usage rights or land ownership.

2.3.3 Recognition of Property Rights

All the AWMSs were invested by the project owner, who has the legal right to control and operate the project activity. The business license, approval of Environmental Impact Assessment (EIA) and the equipment (boiler) purchasing contracts are evidence for the ownership of the project and credits or label issued. All property rights are recognized, respected and supported.

2.3.4 Free, Prior and Informed Consent

The project does not require any change to property or land tenure arrangements. The project owner holds the land title for all swine farms covered in the project activity. All the relevant arrangements are agreed with free, prior and informed consent of the stakeholders.

2.3.5 Restitution and/or Compensation for Affected Resources

There are no negative effects on the land or resources due to the project activity, and allocation of restitution or compensation to any parties is not required.

2.3.6 Property Rights Removal/Relocation of Property Rights Holders

No removal or relocation will occur as a result of this project.

2.3.7 Identification of Illegal Activities

There are no illegal activities identified and associated that could affect the project's impacts, and measures needed and designed to reduce these activities are not required.

⁹ <http://bt.gsxt.gov.cn/index.html>

2.3.8 Ongoing Conflicts or Disputes

There are no ongoing or unresolved conflicts or disputes over rights to lands, territories and resources that will impact the operation and outcomes of the project.

2.3.9 National and Local Laws and Regulations

As per approval of Environmental Impact Assessment (EIA) of the project, the project complies with all relevant laws and regulations of China, mainly includes,

1. Environmental Protection Law of the People's Republic of China.
2. Administrative Licensing Law of the People's Republic of China.
3. Law of the People's Republic of China on Environmental Impact Assessment.
4. Regulations on Environmental Protection Management of Construction Projects.

The project obtained the EIA approval from local governmental authorities. The approvals well demonstrate that local government permits the construction of the project activity. Consequently, the project is compliance with laws, status and other regulatory frameworks.

2.3.10 Project Ownership

The project activity is constructed and operated in the swine farms owned by the project owner. All the AWMSs were invested by the project owner, who has the legal right to control and operate the project activity. The business license, approval of Environmental Impact Assessment (EIA) and the equipment (boiler) purchasing contracts are evidence for the ownership of the project and credits or label issued.

2.3.11 Grouped Projects

The project is not a grouped project.

3 BENEFITS FOR PEOPLE AND PROSPERITY

3.1 Condition of Stakeholders at Project Start

As per section 2.2.2, only the original staff of the swine farm, the local residents around the project site, and the local government are affected by the project activity directly.

Stakeholder Category	Diversity and Interactions	Condition at Project Start	Significant Changes
Original staff of the swine farm	The AWMS of each swine farm will be operated mainly by environmental protection department. Generally, other functional department related to HR, finance will be included in a swine farm.	- Fair recruitment and promotion opportunities are provided to all the employees. - Proper training is conducted as needed. - Equal pay for equal work.	- New colleagues will join to create more possibilities. - The new installed AWMSs will contribute to sustainable development of the swine farm. - Capture of methane will significantly reduce the odor nuisance, and the working environment of the swine farm will be improved. - Knowledge on climate change and carbon reductions will be built gradually.
Local residents around the project site	The project includes 7 swine farms located in rural area of Henan Province. Local residents around the	In 2021, the per capita disposable income of rural residents in Nanyang City, Henan Province	Equal and decent job opportunities will be provided to the local residents.

	project site will be the most direct beneficiaries of the project.	was CNY 17,603, which was 49.89% lower than that of national residents. The situation is worse in rural and remote areas. As per <i>14th Five-Year Rural Revitalization and Agricultural and Rural Modernization Plan of Henan Province issued by Henan Provincial People's Government on 31-December-2021</i>, local government will continue to carry out activities such as reducing and increasing the efficiency of chemical fertilizer, organic fertilizer substitution. However, due to the higher production costs, lack of large-scale special machinery for organic fertilizer application and Slow fertilizer efficiency, etc., it is hard to promote the use of organic fertilizer.	- Some parts of the organic fertilizer produced will be distributed to the local farmers for free. On the one hand, it helps ease the burden of local farmers, on the other hand, it will contribute to promotion of organic fertilizer. - To a certain extent, the local unemployment rate will be reduced, and the living conditions of the local residents will be improved. - Adequate training will be provided to the employees to improve their working skills and the strengths to cope with climate change.
Local government	The local development and reform commission, ecological	In China, the GHG emissions on agriculture, forestry and other land use	To reduce the carbon emissions in agriculture, which will

	environment bureau, and agriculture and rural affairs bureau will be involved in the project activity. Main responsibilities of the local government include making guideline or standard for manure management, approval for construction of the AWMSs, and daily supervision of normal operation of the swine farms.	account for 18.4% of the total carbon emissions. Methane emissions in animal husbandry with a 31.5% share for GHG emissions on agriculture, forestry and other land use¹⁰. China has issued the strategy on carbon peaking and carbon neutrality, and the cap & trade scheme has also been established. However, it only covers the high-emission industries, such as power generation sector that emitted at least 26,000 tons of CO₂e/year¹¹.	contribute to enhance the awareness on climate change, and the early realization of the carbon peak and carbon neutrality vision. - To provide a scalable resourceful animal manure treatment technology for local breeding farms, which will contribute to the long-term low-carbon and sustainable development of the local area. - To reinvigorate the carbon assets of local company, which will help to ease the burden on environmental investment of the local enterprises.

3.2 Expected Impacts on Stakeholders

Impact #1	Increase employment rate in the project area (SDG Indicator: 8.5.2).
------------------	--

¹⁰ https://pdf.dfcfw.com/pdf/H3_AP202204131558974893_1.pdf?1649845991000.pdf

¹¹ http://www.mee.gov.cn/xxgk2018/xxgk/xxgk02/202101/t20210105_816131.html

Type of Impact	New job opportunities will be provided to the local residents, it is positive without cost or a risk to the local residents. The impact is an actual impact which is a direct consequence of the project activity.
Affected Stakeholder Group(s)	Local residents around the project site, and the local government.
Resulting Change in Well-being	The job opportunities are available to the all the local residents around the project site equally. For the local government, the local unemployment rate will be reduced, and the living conditions of the local residents will be improved. To a certain extent, it will help to promote local prosperity and stability.

Impact #2	Promote justice in job recruitment (SDG Indicator: 8.5.2).
Type of Impact	Equal job opportunities will be provided for the local residents regardless of gender. The impact is an actual impact which is a direct consequence of the project activity.
Affected Stakeholder Group(s)	Local residents around the project site.
Resulting Change in Well-being	The project will help to promote the employment of women and other vulnerable members. Decent job opportunities are available to them equally.

Impact #3	Personal skills and environmental awareness will be improved (SDG Indicator: 8.5.2).
Type of Impact	Adequate training will be provided to the employees of the swine farms as needed. The impact is an actual impact which is a direct consequence of the project activity.
Affected Stakeholder Group(s)	Local residents around the project site, and original staff of the swine farm
Resulting Change in Well-being	Trainings will be accessible to all the employees, with emphasis on those recruited from local residents. All the staff working in the swine farms will be informed of risks and trained on measures to avoid it. Personal skills of the employees will be improved to adapt to sustainable development better.

3.3 Stakeholder Monitoring Plan

The project will provide equal and decent job opportunities to the local residents around the project site. The parameters of *Number of jobs for local people created by gender* and *Training times* will be monitored by the project. The stakeholder monitoring plan for the variables linked to the identified project impacts and the claims are described as follows:

SDG Claim	Target: 8.5 By 2030, achieve full and productive employment and decent work for all women and men, including for young people and persons with disabilities, and equal pay for work of equal value Indicator: 8.5.2 Unemployment rate, by sex, age and persons with disabilities
Parameter monitored	<i>Number of jobs for local people created by gender</i>
Affected stakeholder group	Local residents around the project site, and the local government. All the monitoring work will be monitored by the project proponent.
Measurement methods and procedures	The total number of jobs created will be calculated based on the record keeping books, which includes name, gender, date of joining and other basic information of the employees. The results will also be cross checked with labour contracts and training records of the employees.
Monitoring frequency	Once for each monitoring period. After the first verification, only changes in employees will be reported.

SDG Claim	Target: 8.5 By 2030, achieve full and productive employment and decent work for all women and men, including for young people and persons with disabilities, and equal pay for work of equal value Indicator: 8.5.2 Unemployment rate, by sex, age and persons with disabilities
Parameter monitored	<i>Training times</i>
Affected stakeholder group	Local residents around the project site, and original staff of the swine farm. All the monitoring work will be monitored by the project proponent.
Measurement methods and procedures	Training times will be determined based on the training notice and cross-checked by the training attendance form.

Monitoring frequency	Once for each monitoring period.
----------------------	----------------------------------

3.4 Net Positive Stakeholder Well-being Impacts

Impact	Affected Stakeholder Group	Baseline Scenario	Project Scenario	Net Impact
Increase employment rate in the project area.	Local residents around the project site, and the local government.	No related job positions are available in the project site	14 permanent jobs (including 7 females and 7 males) for the local residents will be created during operation period of the project, which will contribute to reducing unemployment rate.	Positive
Promote justice in job recruitment.	Local residents around the project site.	Some job opportunities are not available to women and other vulnerable members.	Equal job opportunities will be provided for the local residents regardless of gender.	Positive
Personal skills and environmental awareness will be improved.	Local residents around the project site, and original staff of the swine farm.	Lack of training on resource reuse on biogas generated from animal waste.	Training on the following aspects will be provided to the employees as needed, Background of carbon emission reductions	Positive

			and climate change. • Basic requirements of Verra for issuance of carbon credits. • Safety operation process of the AWMSs, especially for avoidance of fire and leakage of biogas. • Parameters monitored and methodology.

4 BENEFITS FOR THE PLANET

4.1 Condition of Natural Capital and Ecosystem Services at Project Start

GHG emissions on agriculture, forestry and other land use account for 18.4% of the total carbon emissions in China. Methane emissions in animal husbandry with a 31.5% share for GHG emissions on agriculture, forestry and other land use¹². The common practice for animal waste management is building uncovered anaerobic lagoons/ponds at related farms. Prior to implementation of the project activity, the animal manure was left to decay in the uncovered lagoon at the swine farms and methane is emitted to the atmosphere directly without any methane recovery and destruction facility. In China, the uncovered anaerobic lagoons are a manure treatment method recognized by the state¹³. In addition, since there is no legal regulation to mandate the livestock farm owners to implement anaerobic digestion, aerobic or other biological treatment techniques and to capture and/or utilize methane generated at these lagoons, therefore the continue of this common practice to treatment the manure i.e., uncovered anaerobic lagoons is the most economic, viable and reasonable for livestock farm owners.

The project site is in the swine farm while the construction and operation of swine farm is approved and permitted by local government and the Environmental Impact Assessment (EIA) Report for the project has been approved by local governmental authorities. The project will not have a significant negative impact on the surrounding environment during both construction and operation period. On the contrary, the implementation of the project will significantly improve the quality of the local environment, achieve environmentally sound treatment of agricultural organic waste, reduce the impact of agricultural organic waste on surface water and groundwater, and reduce greenhouse gas emissions. In addition, biogas incineration saves fossil fuels used to generate heat and contributes to sustainable development. Therefore, the project will not pose a threat to any Natural Capital and Ecosystem Services.

4.2 Expected Impacts on Natural Capital and Ecosystem Services

Impact #1	Avoid methane emissions direct to the atmosphere (Goal 13.0)
Type of Impact	All the 7 original uncovered anaerobic lagoons are removed by the project activity, and the methane emissions to the atmosphere will be avoided. The impact is positive, actual and direct. Furthermore, there is no cost or risk to natural capital and ecosystem services.

¹² https://pdf.dfcfw.com/pdf/H3_AP202204131558974893_1.pdf?1649845991000.pdf

¹³ <https://oss.baigongbao.com/2020/12/14/MRyhTKQcWC.pdf>

Affected Natural Capital and/or Ecosystem Service(s)	Carbon emissions and climate change.
Resulting Change in Condition	7 new sets of AWMSs are installed to the 7 existing swine farms to treat the manure and wastewater. Methane emissions generated in the baseline uncovered anaerobic lagoons will be avoided.

Impact #2	Increase the recycling rate of resources (SDG Indicator: 12.5.1)
Type of Impact	The solid is treated in aerobic composting system and the organic fertilizers can be produced, part of the fertilizer is distributed to local farmers for free. The impact is positive, actual and direct. Furthermore, there is no cost or risk to natural capital and ecosystem services.
Affected Natural Capital and/or Ecosystem Service(s)	Waste recycling and usage of renewable energy.
Resulting Change in Condition	In the baseline uncovered anaerobic lagoons, no organic fertilizers can be generated, the generation of organic fertilizer which will help to increase the recycling rate of resources.

Impact #3	Reduce demand for fossil fuels (SDG Indicator: 7.2.1)
Type of Impact	The impact is positive, actual and direct. Furthermore, there is no cost or risk to natural capital and ecosystem services.
Affected Natural Capital and/or Ecosystem Service(s)	Usage of renewable energy.
Resulting Change in Condition	Biogas is a kind of renewable energy. The project activity will help to relieve the CCPG's reliance on fossil fuel.

Impact #4	Promote the use of renewable energy (SDG Indicator: 7.2.1)
------------------	--

Type of Impact	The impact is positive, actual and direct. Furthermore, there is no cost or risk to natural capital and ecosystem services.
Affected Natural Capital and/or Ecosystem Service(s)	Usage of renewable energy.
Resulting Change in Condition	Biogas is a kind of renewable energy. All the heat generated will be used by the 7 swine farms which was provided by the coal-fired boiler without the project. The project activity will help to promote the use of renewable energy.

4.3 Natural Capital and Ecosystem Services Monitoring Plan

The following three parameters need to be monitored for the above impacts. All the parameters will be monitored by the project proponent.

SDG Claim	Goal 13.0: Take urgent action to combat climate change and its impacts
Parameter monitored	<i>GHG emission reductions</i>
Measurement methods and procedures	Baseline, project and leakage emissions will be calculated based on <i>ACM0010 GHG emission reductions from manure management systems</i> (Version 08.0). $\text{GHG emission reductions} = \text{baseline emissions} - \text{project emissions} - \text{leakage emissions}$. Please refer to VCS PD and Validation report of the project for more details.

SDG Claim	SDG Target: 12.5 By 2030, substantially reduce waste generation through prevention, reduction, recycling and reuse SDG Indicator: 12.5.1 National recycling rate, tons of material recycled
Parameter monitored	<i>The amount of the organic fertilizers generated</i>
Measurement methods and procedures	The amount of the organic fertilizers generated during the monitoring period will be measured by electronic truck scale installed in each swine farm. The calibration of electronic truck scale, including the frequency of calibration, should be done every two years in accordance with national standards or requirements. The parameter will be monitored and recorded monthly.

SDG Claim	SDG Target: 7.2 By 2030, increase substantially the share of renewable energy in the global energy mix SDG Indicator: 7.2.1 Renewable energy share in the total final energy consumption
Parameter monitored	<i>The amount of biogas recycled</i>
Measurement methods and procedures	The biogas recycled will be monitored by the flow meter installed at the inlet of boiler in each swine farm. The calibration of flow meters, including the frequency of calibration, should be done every two years in accordance with national standards or requirements. The parameter will be monitored continuously by the flow meter and reported cumulatively on monthly basis.

4.4 Net Positive Natural Capital and Ecosystem Services Impacts

SDG Claim	Parameters Monitored	Baseline Outcome	Project Outcome	Net Benefit
Goal 13.0	<i>GHG emission reductions</i>	Annual baseline emissions 386,779 tCO ₂ e	Annual project emissions 48,344 tCO ₂ e and leakage 16,772 tCO ₂ e	Annual GHG emission reductions: 321,663tCO ₂ e
SDG Indicator 12.5.1	<i>The amount of the organic fertilizers generated</i>	0 tons	77,693tons of organic fertilizers will be produced annually	The amount of the organic fertilizers generated annually: 77,693tons
SDG Indicator 7.2.1	<i>The amount of biogas recycled</i>	0 m ³	3,287.1575*10 ⁴ m ³ of biogas are expected to be recycled annually	The amount of biogas recycled annually: 3,287.1575*10 ⁴ m ³
